Preface

Purpose

The purpose of this guide is to provide instruction for users to independently install, configure, and maintain the AlterPath Console Server. This manual should be read in the order written, with exceptions given in the text. Whether or not you are a UNIX user; we strongly recommend that you follow the steps given in this manual.

Audience and User Levels

This guide is intended for the user who is responsible for the deployment and day-to-day operation and maintenance of the AlterPath Console Server. It assumes that the reader understands networking basics and is familiar with the terms and concepts used in Local and Wide Area Networking. UNIX and Linux users will find the configuration process very familiar. It is not necessary to be a UNIX expert, however, to get the AlterPath Console Server up and running. There are two audiences or user levels for this manual:

New Users
These are users new to Linux and/or UNIX with a primarily PC/Microsoft background. You might want to brush up on such things as common Linux/UNIX commands and how to use the vi editor prior to attempting installation and configuration. This essential background information appears in Appendix A - New User Background Information. It is recommended that New Users configure the AlterPath Console Server using a Web browser, however, New Users can also configure the AlterPath Console Server with vi, the Wizard or the Command Line Interface (CLI).

Power Users
These are UNIX/Linux experts who will use this manual mostly for reference. Power Users can choose between configuring the AlterPath Console Server via Web browser, vi, Wizard, or CLI.

Each configuration task will be separated into a section (a clickable link on the PDF file) for each user type. Users then can skip to the appropriate level that matches their expertise and comfort level.
Preface

How to use this Guide

This guide is organized into the following sections:

- **Chapter 1 - Introduction and Overview** contains an explanation of the product and its default CAS setup. It also includes safety guidelines to be followed.

- **Chapter 2 - Installation, Configuration, and Usage** explains how the AlterPath Console Server should be connected and what each cable is used for. It describes the basic configuration process to get the AlterPath Console Server up and running for its most common uses.

- **Chapter 3 - Additional Features** is dedicated to users wanting to explore all available features of the AlterPath Console Server. It provides configuration instructions for syslog, data buffers, authentication, filters, DHCP, NTP, SNMP, clustering, and sniffing.

- **Appendix A - New User Background Information** contains information for those who are new to Linux/UNIX.

- **Appendix B - Cabling, Hardware, and Electrical Specifications** has detailed information and pinout diagrams for cables used with the AlterPath Console Server.

- **Appendix C - The pslave Configuration File** contains example files for the various configurations as well as the master file.

- **Appendix D - Linux-PAM** enables the local system administrator to choose how to authenticate users.

- **Appendix E - Software Upgrades and Troubleshooting** includes solutions and test procedures for typical problems. In addition, instruction is provided for connection to serial ports through the browser to view the server screen.

- **Appendix F - Certificate for HTTP Security** provides configuration information that will enable you to obtain a Signed Digital Certificate.

- **Appendix G - IPSEC** provides encryption and authentication services at the IP (Internet Protocol) level of the network protocol stack.

- **Appendix H - Web User Management** covers default and optional configuration, and the addition/deletion of users, groups, and access limits.
Preface

- **Appendix I - Connect to Serial Ports from Web** enables this process, based on how the
  serial port is configured.
- **Appendix J - Power Management** instructs on using your Cyclades Console Server with
  various IPDUs.
- **Appendix K - Examples** gives samples and setup for CAS, TS, and Dial-in Access scenarios.
- **Appendix L - Wiz Application Parameters** contains all basic and custom wizard parameters.
- **Appendix M - Copyrights** lists details about applications that were incorporated into the
  product.
- The **Glossary** provides definitions for commonly-used terms in this manual.

Additional Documentation and Help

There are other Cyclades documents that contain background information about Console
Port Management and the Cyclades product line. These are:
- Cyclades’ **Console Management in the Data Center**
- Cyclades’ **Product Catalog**

For the most updated version of Cyclades’ documentation, use the following Web address:

http://www.cyclades.com/support/downloads.php

**Technical Support Centers**

To reach Cyclades’ Technical Support Centers, go to the following:

http://www.cyclades.com/support/technical_support.php
Preface

Conventions and Symbols

This section explains the significance of each of the various fonts, formatting, and icons that appear throughout this guide.

Fonts

This guide uses a regular text font for most of the body text and Courier for data that you would input, such as a command line instruction, or data that you would receive back, such as an error message. An example of this would be:

telnet 200.200.200.1 7001

Hypertext Links

References to another section of this manual are hypertext links that are underlined (and are also blue in the PDF version of the manual). When you click on them in the PDF version of the manual, you will be taken to that section.

Glossary Entries

Terms that can be found in the glossary are underlined and slightly larger than the rest of the text. These terms have a hypertext link to the glossary.

Quick Steps

Step-by-step instructions for installing and configuring the AlterPath Console Server are numbered with a summarized description of the step for quick reference. Underneath the quick step is a more detailed description. Steps are numbered 1, 2, 3, etc. Additionally, if there are sub-steps to a step, they are indicated as Step A, B, C, and are nested within the Step 1, 2, 3, etc. For example:

Step 1: Modify files.
You will modify four Linux files to let the AlterPath Console Server know about its local environment.

Step A: Modify pslave.conf.
Open the file pslave.conf and add the following lines...
Preface

Note Box Icons

Note boxes contain instructional or cautionary information that the reader especially needs to bear in mind. There are five levels of note box icons:

**Tip.** An informational tip or tool that explains and/or expedites the use of the AlterPath Console Server.

**Important!** An important tip that should be read. Review all of these notes for critical information.

**Warning!** A very important type of tip or warning. Do not ignore this information.

**DANGER!** Indicates a direct danger which, if not avoided, may result in personal injury or damage to the system.

**Security Issue.** Indicates security-related information where it is relevant.
Preface

This page has been left intentionally blank.
Introduction and Overview

Introducing Cyclades

Cyclades is a data center fault management company that enables remote management of servers, network equipment and automation devices. Its products help data center managers at enterprise, telecommunication and Internet companies to maximize network and server availability. This results in decreased maintenance costs, increased efficiency and productivity, along with greater control, freedom and peace of mind. Cyclades' advantage is providing scalable products leveraging Linux technology for flexibility and ease of customization.

The AlterPath Console Server

The AlterPath Console Server is line of Console Access and Terminal Servers that allow both local and dial-in access for in-band and out-of-band network management. They run an embedded version of the Linux operating system. Configuration of the equipment is done by editing a few plain-text files, and then updating the versions of the files on the AlterPath Console Server. The files can be edited using the vi editor provided or on another computer with the environment and text editor of your choice. The default “box profile” of the product is that of a Console Access Server.

You can access the AlterPath Console Server via three methods:

- A console directly connected to the AlterPath Console Server
- Telnet/ssh over a network
- A browser

And configure it with any of the following four options:

- vi
- Wizard
- Browser
- Command Line Interface (CLI) - only for certain configuration parameters
Introduction and Overview

There are two models of the AlterPath Console Server: one with a dual power supply and two PCMCIA slots, and one with a single power supply and two PCMCIA slots. While there are two PCMCIA slots in the ACS, only one is currently supported: the bottom slot. Future software versions will allow for use of the top slot.

With the AlterPath Console Server set up as a Console Access Server, you can access a server connected to the ACS through the server’s serial console port from a workstation on the LAN or WAN. There is no authentication by default, but the system can be configured for authentication to be performed by a Radius server, a TacacsPlus server, or even by a local database. Either telnet or ssh (a secure shell session) can be used. See Appendix A - New User Background Information for more information about ssh. The instructions in Chapter 2-Installation, Configuration, and Usage will set up a fully-functional, default CAS environment. More options can be added after the initial setup, as illustrated in Chapter 3-Additional Features.

What’s in the box

There are several models of the AlterPath Console Server with differing numbers of serial ports. Cyclades will ship either Cable Package #1 or #2 with the product according to current availability.

Figure 1: Cable Package #1

AlterPath Console Server
Introduction and Overview

The following figures show the main units and accessories included in each package.

**Note:** Although some ACS units in the figures are shown with a dual power supply (A/C or -48VDC), some models may have single power supply. The single power units will have just one power cable. (ACS48 supports -48VDC.)

Introduction and Overview

Safety Instructions

Read all the following safety guidelines to protect yourself and your AlterPath Console Server.

**DANGER!** Do not operate your AlterPath Console Server with the cover removed.

**DANGER!** In order to avoid shorting out your AlterPath Console Server when disconnecting the network cable, first unplug the cable from the equipment and then from the network jack. When reconnecting a network cable to the equipment, first plug the cable into the network jack, and then into the equipment.

**DANGER!** To help prevent electric shock, plug the AlterPath Console Server into a properly grounded power source. The cable is equipped with a three-prong plug to help ensure proper grounding. Do not use adapter plugs or remove the grounding prong from the cable. If you have to use an extension cable, use a three-wire cable with properly grounded plugs.

**Important!** To help protect the AlterPath Console Server from electrical power fluctuations, use a surge suppressor, line conditioner, or uninterruptible power supply.

**Important!** Be sure that nothing rests on the cables of the AlterPath Console Server and that they are not located where they can be stepped on or tripped over.
Introduction and Overview

**Important!** Do not spill food or liquids on the AlterPath Console Server. If it gets wet, contact Cyclades.

**DANGER!** Do not push any objects through the openings of the AlterPath Console Server. Doing so can cause fire or electric shock by shorting out interior components.

**Important!** Keep your AlterPath Console Server away from heat sources and do not block cooling vents.

**Working inside the AlterPath Console Server**
Do not attempt to service the AlterPath Console Server yourself, except when following instructions from Cyclades Technical Support personnel. In the latter case, first take the following precautions:

- Turn the AlterPath Console Server off.
- Ground yourself by touching an unpainted metal surface on the back of the equipment before touching anything inside it.

**Battery**

**DANGER!** A new battery can explode if it is incorrectly installed. Replace the battery only with the same or equivalent type recommended by the battery manufacturer. Discard used batteries according to the battery manufacturer’s instructions.
Introduction and Overview

FCC Warning Statement

The AlterPath Console Server has been tested and found to comply with the limits for Class A digital devices, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the Installation & Service Manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user is required to correct the problem at his or her own expense.

Notice about FCC compliance for all AlterPath ACS models

In order to comply with FCC standards the AlterPath Console Server require the use of a shielded CAT 5 cable for the Ethernet interface. Notice that this cable is not supplied with either of the products and must be provided by the customer.

Canadian DOC Notice

The AlterPath Console Server does not exceed the Class A limits for radio noise emissions from digital apparatus set out in the Radio Interference Regulations of the Canadian Department of Communications.

L’AlterPath Console Server n’émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la classe A prescrites dans le règlement sur le brouillage radioélectrique edicté par le Ministère des Communications du Canada.
Introduction and Overview

This page has been left intentionally blank.
Chapter 2 - Installation, Configuration, Usage

Introduction

This chapter will allow you to install and configure the AlterPath Console Server as the default CAS configuration. Please read the entire chapter before beginning. A basic installation and configuration should take a half hour at the most, either done manually or with the Wizard.

The AlterPath Console Server operating system is embedded Linux. If you are fairly new to Linux, you will want to brush up prior to proceeding with this chapter with the essential background information presented in Appendix A - New User Background Information. Even if you are a UNIX user and find the tools and files familiar, do not configure this product as you would a regular Linux server.

The chapter is divided into the following sections:

- System Requirements
- Default Configuration Parameters
- Pre-Install Checklist
- Task List
- The Wizard
- Quick Start
- The Installation and Configuration Process

System Requirements

Cyclades recommends either of the following specifications for configuration of the AlterPath Console Server:

- A workstation with a console serial port, or
- A workstation with Ethernet and TCP/IP topology
Chapter 2 - Installation, Configuration, Usage

The following table shows the different hardware required for various configuration methods:

### Table 1: Hardware vs. Configuration Methods

<table>
<thead>
<tr>
<th>Hardware</th>
<th>Configuration Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Console, Console Cable (constructed from RJ-45</td>
<td>vi, Wizard, or CLI</td>
</tr>
<tr>
<td>straight-through cable + adapter)</td>
<td></td>
</tr>
<tr>
<td>Workstation, Hub, Ethernet Cables</td>
<td>vi, Wizard, CLI, or browser</td>
</tr>
</tbody>
</table>

If you will be using vi, the files that need to be changed are discussed in Configuration using Telnet in this chapter. If you will be using the Wizard, basic Wizard access can be found under Configuration Wizard - Basic Wizard in Chapter 3 - Additional Features and specifics of this method are discussed under the appropriate option title in the same chapter. If you choose the browser method, the Quick Start in this chapter shows the screen flow and input values needed for this configuration mode. If you choose the CLI (Command Line Interface) method, this allows you to configure certain parameters for a specified serial port or some network-related parameters. Specifics of this method are discussed under the appropriate option title in Chapter 3 - Additional Features.

### Default Configuration Parameters

- DHCP enabled (if there is no DHCP Server, IP for Ethernet is 192.168.160.10 with a Net-mask of 255.255.255.0)
- CAS configuration
- socket_server in all ports (access method is telnet)
- 9600 bps, 8N1
- No Authentication
Chapter 2 - Installation, Configuration, Usage

Pre-Install Checklist

There are several things you will need to confirm prior to installing and configuring the AlterPath Console Server:

- **Root Access**
  You will need Root Access on your local UNIX machine in order to use the serial port.

- **HyperTerminal, Kermit, or Minicom**
  If you are using a PC, you will need to ensure that HyperTerminal is set up on your Windows operating system. If you have a UNIX operating system, you will be using Kermit or Minicom.

- **IP Address of:**
  - PC or terminal,
  - AlterPath Console Server,
  - NameServer,
  - and Gateway
  You will need to locate the IP address of your PC or workstation, the AlterPath Console Server, and the machine that resolves names on your network. Your Network Administrator can supply you with these. If there is outside access to the LAN that the AlterPath Console Server will be connected with, you will need the gateway IP address as well.

- **Network Access**
  You will need to have a NIC card installed in your PC to provide an Ethernet port, and have network access.

Task List

There are eight key tasks that you will need to perform to install and configure the AlterPath Console Server:

- **Task 1:** Connect the AlterPath Console Server to the Network and other Devices.
- **Task 2:** Configure the COM Port Connection and Log In.
- **Task 3:** Modify the System Files.
- **Task 4:** Edit the pslave.conf file.
- **Task 5:** Activate the changes.
- **Task 6:** Test the configuration.
- **Task 7:** Save the changes.
Chapter 2 - Installation, Configuration, Usage

Task 8: Reboot the AlterPath Console Server.

The Wizard

The eight key tasks can also be done through a wizard in the 2.1plus versions of the AlterPath Console Server.

Basic Wizard
The Basic Wizard will configure the following parameters:

- Hostname
- DHCP enabled/disabled
- System IP (if DHCP is disabled)
- Netmask (if DHCP is disabled)
- Default Gateway
- DNS Server
- Domain

Basic Wizard access is covered in the Quick Start in this chapter and also in Configuration Wizard - Basic Wizard in Chapter 3 - Additional Features.

Custom Wizard
Further configuration of the AlterPath Console Server can be done through one of several customized wizards. These procedures are explained under their respective topic heading in Chapter 3 - Additional Features. There are custom wizards for the following optional configurations:

- Access Method
- Generating Alarms
- Authentication
- Data Buffering
Chapter 2 - Installation, Configuration, Usage

- **Help**
- Power Management (see Appendix J - Power Management)
- **Serial Settings**
- **Session Sniffing**
- **Syslog**
- **Terminal Appearance**
- **TS Setup Wizard** (These are additional configuration parameters applied only to the TS profile.)

**Quick Start**

This Quick Start gives you all the necessary information to quickly configure and start using the AlterPath Console Server as a Console Access Server (CAS). The complete version of this process is listed later in this chapter under The Installation and Configuration Process. New Users may wish to follow the latter instruction set, as this Quick Start does not contain a lot of assumed knowledge.

You can configure the AlterPath Console Server by any one of four methods:

- **Console**
- **Browser**
- **Telnet**
- **CLI (Command Line Interface)**

If you have a serial port that you can use as a console port, use the Console method. If you have access to telnet, you can use this method, while New Users may prefer the Browser method for its user-friendliness.
Chapter 2 - Installation, Configuration, Usage

**Important!** Take care when changing the IP address of the AlterPath Console Server. Confirm the address you are changing it to. (You may want to write it down.)

Configuration using a Console

**Step 1:** Connect the console cable.

Connect the console cable (created from the RJ-45 straight-through cable and the appropriate console adapter) to the port labeled “Console” on the AlterPath Console Server with the RJ-45 connector end, and to your PC’s available COM port with the serial port end.

**Step 2:** Power on the AlterPath Console Server.

After the AlterPath Console Server finishes booting, you will see a login prompt on the console screen.

**Step 3:** Enter `root` as login name and `tslinux` as password.

**Step 4:** Type `wiz` and press Enter.

A configuration wizard screen will appear in your Hyperterminal session, asking you a series of questions.

```
***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system and press ENTER or
2) Press ENTER if you are satisfied with the value within the brackets [ ] and want to go on to the next parameter or
3) Press ESC if you want to exit.
```
NOTE: For some parameters, if there is nothing within the brackets, it will continue to ask for a value. In that case, you must enter a valid value or # if you do not wish to configure the value.

Press ENTER to continue...

You will want to configure the following settings:

- Hostname
- DHCP enabled/disabled
- System IP (if DHCP is disabled)
- Domain Name
- Primary DNS Server
- Gateway IP
- Network Mask (if DHCP is disabled)

After you input the requested parameters you will receive a confirmation screen:

Current configuration:
Hostname : CAS
DHCP : enabled
Domain name : cyclades.com
Primary DNS Server : 197.168.160.200
Gateway IP : 192.168.160.1

If the parameters are correct, “y” should be typed; otherwise, type “n” and then “c” when asked to change the parameters or quit the program. After the parameters are confirmed, the next question will be whether to save the configuration to flash. Select “y” to make the new configuration permanent in non-volatile memory.
Chapter 2 - Installation, Configuration, Usage

After you confirm and save the basic parameters, you will be presented with the shell prompt. From there, either select to continue configuration using the vi editor or use the browser or CLI method (if appropriate).

The AlterPath Console Server is now configured as a CAS with its new IP address, with no authentication, and accepting telnet to the serial ports. You can telnet the CAS IP + serial port 1 with the following command:

telnet <IP assigned by DHCP Server or by you> 7001

To explore the AlterPath Console Server features, either continue configuration using the vi editor from the console or use a browser from a workstation and point to the AlterPath Console Server, or use the CLI, if appropriate (as indicated in the relevant sections in Chapter 3).

Configuration using a Web browser

The AlterPath Console Server box comes with DHCP client enabled. If you have a DHCP Server installed on your LAN, you can skip Step 2 below. If not, the DHCP request will fail and an IP address pre-configured on the Console server’s Ethernet interface (192.168.160.10) will be used instead. To access the box using your browser:

**Step 1: Connect Hub to workstation and ACS.**
Your workstation and your ACS must be on the same physical LAN. Connect one RJ-45 cable from the Ethernet port of the ACS to a spare port from a hub, and another cable from another spare port of that same hub to the workstation used to manage the servers.

**Step 2: If you do not have a DHCP Server in your LAN, add a route pointing to the ACS IP.**
From the workstation, issue a command to add a route pointing to the network IP address of the ACS (192.168.160.0) accessed through the workstation’s Ethernet interface.
For Linux, the command would be:

```
route add -net 192.168.160.0/24 gw <IP address assigned to the workstation’s Ethernet interface>
```

Example: if the workstation has IP address 200.246.93.150 the command would be:

```
route add -net 192.168.160.0/24 gw 200.246.93.150
```

For Windows, the command would be:

```
route add 192.168.160.0 mask 255.255.255.0 <IP address assigned to the workstation’s Ethernet interface>
```

Example: if the workstation has IP address 200.246.93.150 the command would be:

```
route add 192.168.160.0 mask 255.255.255.0 200.246.93.150
```

**Step 3:** Point your browser to the IP address assigned by the DHCP Server (or to 192.168.160.10 if there is no DHCP Server in your LAN).
The login page shown in the following figure will appear.

![Login page of Web Configuration Manager](image)
Chapter 2 - Installation, Configuration, Usage

Step 4: Enter root as login name and tslinux as password.

Step 5: Click the Submit button.

This will take you to the Configuration & Administration Menu page, shown in the following figure:

![Configuration & Administration Menu page](image)

This page gives a brief description of all menu options. A menu of links is provided along the left side of the page. A summary of what each link leads to is shown on Table 3: Configuration Section through Table 6: Information Section.

**Security Issue.** Change the password of the Web root user as soon as possible. The user database for the Web Configuration Manager is different than the system user database, so the root password can be different. See Changing the Root Password in Appendix H - Web User Management.

Step 6: Click on the General link.
Step 7: Configure parameters presented in the fields.

Step 8: Click on the Submit button.

Step 9: Make the changes effective.
   Click on the Administration > Run Configuration link, check the Serial Ports/ Ethernet/Static Routes box and click on the Activate Configuration button. If you disabled DHCP and changed your Ethernet IP, you will lose your connection. You will need to use your browser to connect to the new IP.
Step 10: Click on the Save Configuration to Flash button.
The configuration was saved in flash. The new configuration will be valid and running. The AlterPath Console Server is now configured as a CAS with its assigned (by DHCP Server or you) IP address, with no authentication, and accepting telnet to the serial ports. You can telnet the CAS IP + serial port 1 with the following command:

telnet <IP assigned> 7001

Note. Serial port 1 is configured as 9600, 8N1 by default. The server connected to this serial port has to have the same configuration for its serial port.

To explore the AlterPath Console Server features, either continue configuration using your browser, use the vi editor from the console, or use CLI, if appropriate.

A description of each of the links on the five sections of the Configuration and Administration menu page is provided on the following five tables:

**Note:** The link Connect to Serial Ports is only available for all ACS models. See “Appendix I - Connect to Serial Ports from Web” on page 379.
Chapter 2 - Installation, Configuration, Usage

Configuration using Telnet

The AlterPath Console Server box comes with DHCP client enabled. If you have a DHCP Server installed on your LAN, you can skip Step 2 below. If not, the DHCP request will fail and an IP address pre-configured on the Console server's Ethernet interface (192.168.160.10) will be used instead. To access the box using telnet:

Step 1: Connect Hub to workstation and ACS.
Your workstation and your ACS must be on the same physical LAN. Connect one RJ-45 cable from the Ethernet port of the ACS to a spare port from a hub, and another cable from another spare port of that same hub to the workstation used to manage the servers.

Step 2: If you do not have a DHCP Server in your LAN, add a route pointing to the ACS IP.
From the workstation issue a command to add a route pointing to the network IP address of the ACS (192.168.160.0) accessed through the workstation’s Ethernet interface.

For Linux, the command would be:

    route add -net 192.168.160.0/24 gw <IP address assigned to the workstation’s Ethernet interface>

Example: if the workstation has IP address 200.246.93.150 the command would be:

    route add -net 192.168.160.0/24 gw 200.246.93.150

For Windows, the command would be:

    route add 192.168.160.0 mask 255.255.255.0 <IP address assigned to the workstation’s Ethernet interface>

Example: if the workstation has IP address 200.246.93.150 the command would be:

    route add 192.168.160.0 mask 255.255.255.0 200.246.93.150

Step 3: Telnet to <IP assigned by DHCP Server or 192.168.160.10 if there is no DHCP Server>.

Step 4: Enter root as login name and tslinux as password.
Step 5: Type `wiz` and press Enter.

A Configuration Wizard screen will appear on your telnet screen, asking you a series of questions.

***********************************************************
******** *CONFIGURATION WIZARD ********
***********************************************************

INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system and press ENTER. Enter '#' if you want to deactivate that parameter or
2) Press ENTER if you are satisfied with the value within the brackets [ ] and want to go on to the next parameter or
3) Press ESC if you want to exit.

NOTE: For some parameters, if there is nothing within the brackets, it will continue to ask for a value. In that case, you must enter a valid value or # if you do not wish to configure the value.

Press ENTER to continue...

After you input the requested parameters you will receive a confirmation screen:

Current configuration:
Hostname : CAS
DHCP: disabled
System IP : 192.168.160.10
Domain name : cyclades.com
Primary DNS Server : 197.168.160.200
Gateway : eth0
Network Mask : 255.255.255.0
Chapter 2 - Installation, Configuration, Usage

If the parameters are correct, “y” should be typed; otherwise, type “n” and then “c” when asked to change the parameters or quit the program. After the parameters are confirmed, the next question will be whether to save the configuration to flash. Select “y” to make the new configuration permanent in non-volatile memory.

At this point you may lose your connection when saving the changes, if you disabled DHCP and assigned an IP address. Don’t worry! The new configuration will be valid. The AlterPath Console Server is now configured as a CAS with its assigned (by DHCP or you) IP address, with no authentication, and accepting telnet to the serial ports. You can telnet the CAS IP + serial port 1 with the following command:

telnet <IP assigned> 7001

Note. Serial port 1 is configured as 9600, 8N1 by default. The server connected to this serial port has to have the same configuration for its serial port.

After you confirm the basic parameters, you will be presented with the shell prompt. From there, either select to continue configuration using the vi editor or continue using a browser. For additional configuration, see Chapter 3 - Additional Features in this guide.
Chapter 2 - Installation, Configuration, Usage

The Installation and Configuration Process

Task 1: Connect the AlterPath Console Server to the Network and other Devices

Power Users
Connect a PC or terminal to the AlterPath Console Server using the console cable. If you are using a PC, HyperTerminal can be used in the Windows operating system and Kermit or Mini-com in the UNIX operating system. When the AlterPath Console Server boots properly, a login banner will appear. Log in as root (default password is tslinux). A new password should be created as soon as possible. The terminal parameters should be set as follows:

- Serial Speed: 9600 bps
- Data Length: 8 bits
- Parity: None
- Stop Bits: 1 stop bit
- Flow Control: none
- ANSI emulation

You may now skip to Task 4: Edit the pslave.conf file.

**Important!** Any configuration change must be saved in flash once validated. To save in Flash run saveconf (see Task 7: Save the changes). To validate/activate a configuration, run signal_ras_hup (see Task 5: Activate the changes).

**Note:** If your terminal does not have ANSI emulation, select vt100; then, on the ACS, log in as root and switch to vt100 by typing:

```
TERM=vt100;export TERM
```
Chapter 2 - Installation, Configuration, Usage

Tip. We strongly recommend to use 9600 bps console speed. In case you need to use another speed please check Appendix E - Software Upgrades and Troubleshooting.

Important! Always complete ALL the steps for your chosen configuration before testing or switching to another configuration.

New Users
If you are using a PC, you will be using HyperTerminal to perform the initial configuration of the AlterPath Console Server directly through your PC’s COM port connected with the AlterPath Console Server console port. HyperTerminal, which comes with Windows 95, 98, Me, NT, 2K, and XP is often located under Start > Program > Accessories. HyperTerminal emulates a dumb terminal when your PC connects to the serial port (console port) of the AlterPath Console Server.

After the initial configuration through the HyperTerminal connection, you will be connecting your PC (or another terminal) to the AlterPath Console Server via an Ethernet connection in order to manage the ACS. The workstation used to access the ACS through telnet or ssh uses a LAN connection.

These events can be summarized as follows:

- PC (Hyper terminal): COM port connects via serial cable to the ACS’s console port.
- PC (Ethernet): Ethernet port connects via hub to the ACS’s Ethernet port.
- Use the HyperTerminal to configure the box.
- Use the PC Ethernet to access the box as client (telnet/ssh).
Chapter 2 - Installation, Configuration, Usage

Step 1: Plug the power cable into the AlterPath Console Server.
Insert the female end of the black power cable into the power socket on the AlterPath Console Server and the three-prong end into a wall outlet.

DANGER! To help prevent electric shock, plug the AlterPath Console Server into a properly grounded power source. The cable is equipped with a 3-prong plug to help ensure proper grounding. Do not use adapter plugs or remove the grounding prong from the cable. If you use an extension cable, use a 3-wire cable with properly grounded plugs.

Step 2: Connect the console cable.
You will be constructing a Console Cable out of the RJ-45 straight-through cable and the appropriate adapter provided in the product box. (There are four options: all adapters have an RJ-45 connector on one end, and either a DB25 or DB9 connector on the other end, male or female). Connect this cable to the port labeled “Console” on the AlterPath Console Server with the RJ-45 connector end, and connect the adapter end to your PC’s available COM port. For more detailed information on cables, see Appendix B - Cabling, Hardware, and Electrical Specifications.

Note: The modem cable is not necessary for a standard installation and configuration. Use it when the configuration is complete and you want to access the box remotely through a serial port.

Step 3: Connect Hub to PC and the AlterPath Console Server.
Your workstation and ACS must be on the same physical LAN. Connect one RJ-45 cable from the Ethernet port of the ACS to the hub, and another from the hub to the workstation used to manage the servers.

Step 4: Install and launch HyperTerminal, Kermit or Minicom if not already installed.
You can obtain the latest update to HyperTerminal from:
http://www.hilgraeve.com/htpe/download.html
Task 2: Configure the COM Port Connection and Log In

**Step 1: Select available COM port.**
In HyperTerminal (Start > Program > Accessories), select File > Properties, and click the Connect To tab. Select the available COM port number from the Connection dropdown.

![New Connection Properties](image)

Figure 11: Choose a free COM port

**Step 2: Configure COM port.**
Click the Configure button (hidden by the dropdown menu in the above figure). Your PC, considered here to be a “dumb terminal,” should be configured to use 9600 bps, 8 data bits, no parity, 1 stop bit, and no flow control (as shown in the following figure).
Chapter 2 - Installation, Configuration, Usage

Figure 12: Port Settings

Step 3: Power on the AlterPath Console Server.

Step 4: Click OK on the Properties window.
You will see the Cyclades booting on your screen. After it finishes booting, you will see a login prompt.
Chapter 2 - Installation, Configuration, Usage

Task 3: Modify the System Files

When the AlterPath Console Server finishes booting, a prompt will appear (a flashing underline cursor) in your HyperTerminal window. You will modify the following Linux files to let the AlterPath Console Server know about its local environment:

/etc/hostname
/etc/hosts
/etc/resolv.conf
/etc/network/st_routes

The four Linux files must be modified to identify the ACS and other devices it will be communicating with. The operating system provides the vi editor, which is described in Appendix A - New User Background Information for the uninitiated. The AlterPath Console Server runs Linux, a UNIX-like operating system, and those not familiar with it will want to refer to Appendix A.

Step 1: Type `root` and press Enter.

Step 2: At the password prompt, type `tslinux`. Press Enter.

Step 3: Modify `/etc/hostname`.

In HyperTerminal, type "vi /etc/hostname" (without the quotes) and press Enter. Arrow over the existing text in the file, type “r” (for replace) and type the first number of the model of your AlterPath Console Server. (Or, you can replace the default naming convention with anything you’d like for your hostname.) When finished, press the Esc key, (to return to command mode), then type “:.” (colon), and then “wq” and press Enter. This will save the file. (The only entry in this file should be the hostname of the AlterPath Console Server.) An example is shown in the following figure. (The HyperTerminal screen is shown in this first example for clarity, however, for the other Linux files we will modify, only the command line text will be shown.)
Chapter 2 - Installation, Configuration, Usage

Step 4: Modify /etc/hosts.

This file should contain the IP address for the Ethernet interface and the same hostname that you entered in the /etc/hostname file. It may also contain IP addresses and host names for other hosts in the network. Modify the file using the vi as you did in Step 1.

**Figure 14: Contents of the /etc/hosts file**

Step 5: Modify /etc/resolv.conf.

This file must contain the domain name and nameserver information for the network. Obtain the nameserver IP address from your Network Administrator. The default contents of this file are:

```
domain mycompany.com
nameserver 200.200.200.2
```

Step 6: Modify /etc/network/st_routes.

The fourth file defines static routes. In the console server example in Figure 56: Console Access Server diagram, the router is a gateway router and thus its IP address is configured in this file to be the default gateway. Other static routes are also configured in this file. If you will be managing servers through a LAN, you don’t need...
to alter this file. If you will be managing via Internet, you will be connecting through a router, and thus need to modify this file. You would get the IP address from your Network Administrator. The default contents of this file are:

```
route add default dev eth0
```

**Step 7: Change password for root and new users.**

The default `/etc/passwd` file has the user “root” with password “tslinux”. You should change the password for user root as soon as possible. Before changing any password or adding new users you should also activate shadow password, if it is needed. The AlterPath Console Server has support for shadow password, but it is not active by default. To activate shadow password follow the steps listed below:

**Step A:** Create an empty file called `/etc/shadow`.

```
# cd /etc
# touch shadow
```

**Step B:** Add a temporary user to the system. It will be removed later.

```
# adduser boo
```

**Step C:** Edit the file `shadow`.

For each user in passwd file, create a copy of the line that begins with “boo:” in the shadow file, then replace “boo” with the user name. The line beginning with “root” must be the first line in the file `/etc/shadow`.

**Step D:** Edit the `passwd` file.

Replace the password in all password fields with an “x”. The root’s line will look like this:

```
“root:x:0:0:root:/root:/bin/sh”
```

^ password field

**Tip.** Using the vi editor, put the cursor in the first byte after “root:”, then type “ct:x” plus <ESC>>.
Step E: Remove the temporary user boo.

# deluser boo

Step F: Change the password for all users and add the new ones needed.

# passwd <username>
or
# adduser <username>

Step G: Edit /etc/config_files and add a line with “/etc/shadow.”

Task 4: Edit the pslave.conf file

This is the main configuration file (/etc/ports/pslave.conf) that contains most product parameters and defines the functionality of the AlterPath Console Server. Only three parameters need to be modified or confirmed for a basic configuration:

- conf.eth_ip (if you disabled DHCP)
- all.authtype
- all.protocol

Tip. You can do a find for each of these parameters in vi, once you open this file by typing /<your string> to search the file downward for the string specified after the /.

A listing of the pslave.conf file with all possible parameters, as well as the files used to create other configurations from parameters in this file, is provided in Appendix C - The pslave Configuration File. Additional, optional modifications made to this file will depend on the configuration desired.

There are three basic types of parameters in this file:

- conf.* parameters are global or apply to the Ethernet interface.
- all.* parameters are used to set default parameters for all ports.
- s#* parameters change the default port parameters for individual ports.
Chapter 2 - Installation, Configuration, Usage

An all.* parameter can be overridden by a s#.* parameter appearing later in the pslave.conf file (or vice-versa).

**Power Users:** To find out what to input for these three parameters so that you can configure what you need, go the appropriate appendix, where you will find a complete table with an explanation for each parameter. You can use the templates from that same Appendix (pslave.conf.cas, etc.) as reference.

**conf.eth_ip**  
This is the IP address of the Ethernet interface. Use it if you don't have DHCP Server in your LAN. An example value would be:

```
200.200.200.1
```

**all.authtype**  
This parameter controls the authentication required by the AlterPath Console Server. The authentication required by the device to which the user is connecting is controlled separately. There are several authentication type options:

- **none** (no authentication)
- **local** (authentication is performed using the /etc/passwd file)
- **remote** (This is for a terminal profile only. The unit takes in a username but does not use it for authentication. Instead it passes it to the remote server where it is then used for authentication.)
- **radius** (authentication is performed using a Radius authentication server)
- **TacacsPlus** (authentication is performed using a TacacsPlus authentication server)
- **Idap** (authentication is performed against an Idap database using an Idap server. The IP address and other details of the Idap server are defined in the file /etc/ldap.conf)
Chapter 2 - Installation, Configuration, Usage

all.authtype (cont.)

- kerberos (authentication is performed using a kerberos server. The IP address and other details of the kerberos server are defined in the file /etc/krb5.conf)
- local/radius (authentication is performed locally first, switching to Radius if unsuccessful)
- radius/local (the opposite of the previous option)
- local/TacacsPlus (authentication is performed locally first, switching to TacacsPlus if unsuccessful)
- TacacsPlus/local (the opposite of the previous option)
- RadiusDownLocal (local authentication is tried only when the Radius server is down)
- TacacsPlusDownLocal (local authentication is tried only when the TacacsPlus server is down)

An example value would be: radius

all.protocol

For the console server configuration, the possible protocols are:

- socket_server (when telnet is used)
- socket_ssh (when ssh version one or two is used)
- raw_data (to exchange data in transparent mode – similar to socket_server mode, but without telnet negotiation, breaks to serial ports, etc.)

An example value would be: socket_server

The Authentication feature

See Authentication in Chapter 3 - Additional Features.
Chapter 2 - Installation, Configuration, Usage

Task 5: Activate the changes

Execute the following command in HyperTerminal to activate the changes:

```
signal_ras hup
```

Task 6: Test the configuration

Now you will want to make sure that the ports have been set up properly.

**Step 1:** Ping the ACS from a DOS prompt.

Open a DOS window, type in the following, and then press Enter:

```
ping <IP assigned to the ACS by DHCP or you>
```

An example would be:

```
ping 192.168.160.10
```

If you receive a reply, your ACS connection is OK. If there is no reply see Appendix E - Software Upgrades and Troubleshooting.

**Step 2:** Telnet to the server connected to the first port of the AlterPath Console Server.

(This will only work if you selected socket_server as your all.protocol parameter.)

While still in the DOS window, type the following and then press Enter:

```
telnet <IP assigned to the ACS by DHCP or you> 7001
```

An example would be:

```
telnet 192.168.160.10 7001
```

If everything is configured correctly, a telnet session should open on the server connected to port 1. If not, check the configuration, follow the above steps again, and check Appendix E - Software Upgrades and Troubleshooting.

Task 7: Save the changes

Execute the following command in HyperTerminal to save the configuration:

```
saveconf
```
Chapter 2 - Installation, Configuration, Usage

Task 8: Reboot the AlterPath Console Server

After rebooting, the initial configuration is complete.

**Note:** saveconf is equivalent to `tar -czf /proc/flash/script -T /etc/config_files` in standard Linux (saveconf must be used because `tar` on the ACS does not support the `z` flag).

**Note:** restoreconf does the opposite of saveconf, copying the contents of the `/proc/flash/script` file to the corresponding files in the ramdisk. The files on the ramdisk are overwritten. Restoreconf is run automatically each time the AlterPath Console Server is booted.

**Accessing the Serial Ports**

There are four ways to access the serial ports, depending on the protocol you configured for that serial port (all.protocol being `socket_server` for telnet access, `socket_ssh` for ssh access, etc). One can access the serial port by statically addressing it (using TCP port number, alias name or IP address) or just access the next free serial port available from an existent pool (by using the pool's TCP port number, alias or IP address). For details on configuration to access using telnet or ssh please see Access Method, Configuration for CAS in Chapter 3.

**Opening and closing a telnet session to a serial port**

To open a telnet session to a serial port or the first free serial port belonging to a pool of serial ports, issue the command:

```
telnet <CAS hostname> <TCP port number>
```
<CAS hostname> is the hostname configured in the workstation where the telnet client will run (through /etc/hosts or DNS table). It can also be just the IP address of the AlterPath ACS (Ethernet's interface) configured by the user or learned from DHCP.

<TCP port number> is the number associated to the serial port or pool of serial ports. From factory, 7001 corresponds to serial port 1, 7002 to serial port 2 and so forth, and 3000 is a pool with all serial ports.

To close the telnet session, just press the telnet hot key configured in telnet client application (usually it's "Ctrl J") and "q" to quit.

Opening and closing an SSH session to a serial port

To open an ssh session to a serial port or the next free serial port from a pool, issue the command:

```
ssh -l <Username>:<Server> <CAS hostname>
```

<Username> is the user configured to access that serial port. It is present either in the local CAS database or in a Radius/Tacacs/LDAP/Kerberos, etc database.

<Server> can be just the TCP port number assigned for that serial port (7001, 7002, etc), pool of ports (3000, etc), the alias for the server connected to that serial port or the alias of a pool of ports.

<CAS hostname> is the hostname configured in the workstation where the ssh client will run (through /etc/hosts or DNS table). It can also be just the IP address of the AlterPath ACS (Ethernet's interface) configured by the user or learned from DHCP.

To exit the ssh session, press the hot key configured for that ssh client (usually ".~").

Accessing Serial Ports using “ts_menu”

To access the serial port (telnet or ssh) using ts_menu, login to the CAS unit and, after receiving the shell prompt, run ts_menu. The servers (aliases) or serial ports will be shown as option to start a connection (telnet/ssh). After typing ts_menu, you will see something similar to the following:
Serial Console Server Connection Menu for your Master Terminal Server

1 ttyS1 2 ttyS2 3 ttyS3 4 ttyS4
5 ttyS5 6 ttyS6 7 ttyS7 8 ttyS8

Type 'q' to quit, a valid option[1-8], or anything else to refresh:

How to close the session from ts_menu (from the console of your unit)

**Step 1: Enter the escape character.**

The escape character is shown when you first connect to the port.
In character/text Mode, the Escape character is ^]  

After entering the escape character, the following is shown:

Console escape. Commands are:

```
l go to line mode
 c go to character mode
z suspend telnet
 b send break
 t toggle binary
e exit telnet
```

**Step 2: Press “e” to exit from the session and return to the original menu.**

Select the exit option and you will return to the shell prompt.

How to close the session from ts_menu (from a telnet session to your unit)

You have to be sure that a different escape character is used for exiting your telnet session; otherwise, if you were to exit from the session created through the ts_menu, you will close your entire telnet session to your unit. To do this, when you first telnet to your unit, use the “e” option. So for example, to set Ctrl-? as the escape character, type /telnet -e ^? 192.168.160.10/. To exit from the session created through the ts_menu, just follow Step 1 from above. To exit from the entire telnet session to your unit, type the escape character you had set.
Accessing Serial Ports using the Web Interface

From the Web, there's a “Connect to Serial Port” option that has to be selected. A serial port is chosen and a Java window will open on the user's screen. For a telnet session, just log in and provide the password (whenever necessary). For ssh, enter

\(<\text{username}>:<\text{TCP port number or alias for the server}>\)

as login name and provide the password (whenever necessary). To exit the session, select “Disconnect” from the Java window. See the Step-by-Step Process section of Appendix I - Connect to Serial Ports from Web for more details.
Chapter 3 - Additional Features

Introduction

After the Configuration Wizard section in this chapter, each of the following sections is listed alphabetically and shows how to configure the option using vi, the custom Wizard (when available), browser, where appropriate, and the Command Line Interface (CLI), when available. This chapter contains the following sections:

- Configuration Wizard - Basic Wizard
- Access Method
- Authentication
- Clustering
- CronD
- Data Buffering
- DHCP
- Dual Power Management
- Filters and Network Address Translation
- Generating Alarms
- Help
- NTP
- PCMCIA
- Ports Configured as Terminal Servers
- Serial Settings
- Session Sniffing
- SNMP
- Syslog
- Terminal Appearance
Chapter 3 - Additional Features

- **Time Zone**

### Configuration Wizard - Basic Wizard

The configuration wizard application is a quicker and easier way to configure the AlterPath Console Server. It is recommended that you use this application if you are not familiar with the vi editor or if you just want to do a quick installation of the ACS.

The command `wiz` gets you started with some basic configuration. After executing this command, you can continue the configuration of the ACS using any browser or by editing system files with the vi editor. What follows are the basic parameters to get you quickly started. The files that will be eventually modified if you decide to save to flash at the end of this application are:

1. /etc/hostname
2. /etc/hosts
3. /etc/resolv.conf
4. /etc/network/st_routes
5. /etc/network/ifcfg_eth0
6. /etc/portslave/pslave.conf

**Step 1:** **Enter the command** `wiz`.

At the command prompt type “wiz” in your terminal to bring up the wizard. You will receive an initial instruction screen.

```
***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system and press ENTER or
2) Press ENTER if you are satisfied with the value
```

AlterPath Console Server
within the brackets [ ] and want to go on to the next parameter or
3) Press ESC if you want to exit.
NOTE: For some parameters, if there is nothing within the brackets, it will continue to ask for a value. In that case, you must enter a valid value or # if you do not wish to configure the value.

Press ENTER to continue...

Step 2: Press Enter to continue with the wizard.
You will see the current configurations and have the choice of setting them to default values, or not.

*******************************
********* CONFIGURATION WIZARD *********
*******************************

Current configuration:

Hostname: CAS
DHCP: enabled
Domain name: #
Primary DNS Server: #
Gateway IP: eth0

Set to defaults? (y/n) [n] :

Step 3: Press Enter or type n or y.
The default answer or value to any question is in the brackets. You can take one of three actions:

• Either just press the ENTER key to execute whatever is in between the brackets, or
• Type n to NOT reset the current configurations to the Cyclades defaults, or
• Type y to reset to Cyclades default configurations.
Chapter 3 - Additional Features

**Tip.** On most of the following configuration screens, the default or current value of the parameter is displayed inside brackets. Just press the ENTER key if you are satisfied with the value in the brackets. If not, enter the appropriate parameter and press ENTER.

If at any time after choosing whether to set your configurations to default or not, you want to exit the wizard or skip the rest of the configurations, press ESC. This will immediately display a summary of the current configurations for your verification before exiting the application. This will not work if you did not enter a valid choice for the parameter you are currently on.

For some parameters, if there is nothing within the brackets, it will continue to ask for a value. In that case, you must enter a valid value or # if you do not wish to configure the value.

**Step 4:** Enter Hostname and then press the Enter key.

This is an alias for your ACS that allows you to refer to the ACS by this name rather than its IP address. Enter hostname after the prompt:

Hostname[CAS]:

**Step 5:** Type y, n, or press Enter to enable or disable DHCP client.

Type y or press Enter if there is a DHCP Server in your LAN, to have the Dynamic Host Configuration Protocol (DHCP) automatically assign an IP address for your ACS. Type n to manually assign an IP address.

Do you want to use dhcp to automatically assign an IP for your system (y/n) [y]:

**Note:** Typing y omits Steps 6 and Step 10.

**Step 6:** If DHCP client is disabled, enter IP Address of your ACS and then press the Enter key.
Chapter 3 - Additional Features

If the DHCP client is enabled, skip this step. This question will only appear if DHCP client is disabled. This is the IP address of the ACS within your network. See your network administrator to obtain a valid IP address for the ACS.

IP of your system[]: 192.168.160.10

Step 7: Enter Domain name and then press Enter.
Domain name locates or identifies your organization within the Internet.

Domain name[#]: cyclades.com

Step 8: Enter IP address of Domain Name Server and press Enter.
At the prompt, enter the IP address of the server that resolves domain names. Your domain name is alphabetical so that it is easier to remember. Every time you see the domain name, it is actually being translated into an IP address by the domain name server. See your network administrator to obtain this IP address for the domain name server.

Domain Name Server[#]: 192.168.160.200

Step 9: Enter Gateway IP address and press Enter.
The Gateway is a node on a network that serves as an entrance point into another network. See your network administrator to find out your organization's gateway address.

Gateway IP[eth0]: 192.168.160.1

Step 10: If DHCP client is disabled, enter Netmask and press Enter.
If the DHCP client is enabled, skip this step. This question will appear only if DHCP client is disabled. The Netmask is a string of 0s and 1s that mask or screen out the host part of an IP address so that only the network part of the address remains.

Netmask[#]: 255.255.255.0

Step 11: Review configuration parameters.
You will now have the parameters you just configured displayed back to you. If you entered y in Step 5:

******************************************************
********* CONFIGURATION WIZARD ***********
Chapter 3 - Additional Features

*******************************************************************

Current configuration:

Hostname: CAS
DHCP: enabled
Domain name: cyclades.com
Primary DNS Server: 197.168.160.200
Gateway IP: 192.168.160.1

Are all these parameters correct (Y)es or (N)o [N]:

If you entered n in Step 5:

Current configuration:

Hostname: CAS
DHCP: disabled
System IP: 192.168.160.10
Domain name: cyclades.com
Primary DNS Server: 192.168.160.200
Gateway IP: 192.168.160.1
Network Mask: 255.255.255.0

Are all these parameters correct (y/n) [y]:

Step 12: Type y, or n, or press Enter.

Type y if all parameters are correct. Type n or just press ENTER if not all the parameters are correct and you want to go back and redo them.

Step 13: If you typed n in Step 11, type c or q.

As directed by the prompt, type c to go back to very beginning of this application to change the parameters. Type q to exit.
Chapter 3 - Additional Features

Step 14: If you typed y in Step 11, choose whether to activate your configurations.

***********************************************************
******** *CONFIGURATION WIZARD ********
***********************************************************

You can now use the browser to finish your system configurations, but before that, please read below.

(Note: If you are NOT connected to this unit through a console, and you have just reconfigured the IP of this unit, activating the new configurations may cause you to lose connection. In that case, please reconnect to the unit by the new IP address, and manually issue a saveconf to save your configurations to flash.)

Do you want to activate your configurations now? (y/n) [y] :

Step 15: Choose whether to save to flash.

Flash is a type of memory that will maintain the information saved on it even after the AlterPath Console Server is turned off. Once it is turned on again, the saved information can be recovered. If y is entered, the screen will display an explanation of what saving to flash means:

Flash refers to a type of memory that can be erased and reprogrammed in units of memory known as blocks rather than one byte at a time, thus making updating to memory easier.

If you choose to save to flash, your configurations thus far will still be in the memory of the ACS even after you reboot it. If you don't save to flash and if you were to reboot the system, all your new configurations will be lost and you will have to reconfigure the ACS.

Do you want to save your configurations to flash? (y/n) [n]:
Chapter 3 - Additional Features

Step 16: Type ‘y’ if you want to save to flash. Type ‘n’ if you don’t want to save to flash.

You can now continue ACS configurations using the Web browser by typing in the IP address of the ACS.

Using the Wizard through your Browser

The Web interface supports wizards for serial ports configuration. The wizard is a useful tool that simplifies configuration of serial ports. The Web interface will access the following wizard files:

- /etc/portslave/pslave.wiz.cas (CAS)
- /etc/portslave/pslave.wiz.ts (TS)
- /etc/portslave/pslave.wiz.ras (Dial-in Access)

The step-by-step process to configuring ports for a specific profile appear in the following sections, and the exact screen flow begins with Figure 15: Configuration and Administration page.

To summarize the process, the wizard configuration is started by first selecting the desired port(s) on the Port Selection page (Figure 16: Port Selection page), clicking Submit, and then selecting either the CAS, TS, or RAS profile buttons on the subsequent Serial Port Configuration Page(Figure 17: Serial Port Configuration page). Change the appropriate parameters, and then click the Submit button on the Serial Port Configuration Page. For most applications, the parameters to be changed are:

For CAS:
- Port Speed
- First RADIUS/TacacsPlus Authentication Server
- First Accounting Server
- RADIUS/TacacsPlus secret
- Protocol (if the protocol is Socket SSH, Socket Telnet, or Socket Raw)
- Socket Port (keep the “Incremented” option on)
Chapter 3 - Additional Features

For TS:
- Port Speed
- First RADIUS/TacacsPlus Authentication Server
- First Accounting Server
- RADIUS/TacacsPlus secret
- Protocol (if the protocol is Login, Rlogin, SSH, or Socket Client)
- Socket Port (write the TCP port for the protocol selected; keep the “incremented” option off)

For Dial-in access:
- First RADIUS/TacacsPlus Authentication Server
- First Accounting Server
- RADIUS/TacacsPlus secret
- Remote IP Address (keep the “Incremented” option on)

Access Method

Access method is how a user accesses a server connected to one of the serial ports on the AlterPath Console Server (CAS profile) or how a user connected to one of the serial ports accesses a server in the network (TS profile or Dial-In profile).

Configuration for CAS

Parameters Involved and Passed Values
The parameters involved in configuring Access Method for CAS are as follows:
Chapter 3 - Additional Features

**all.ipno**
This is the default IP address of the AlterPath Console Server's serial ports. Any host can access a port using its IP address as long as a path to the address exists in the host's routing table. An example value would be 192.168.1.101+. The “+” indicates that the first port should be addressed as 192.168.1.101 and the following ports should have consecutive values.

**all.socket_port**
In the CAS profile, this defines an alternative labeling system for the AlterPath Console Server ports. An example value would be 7001+. The “+” after the numerical value causes the serial interfaces to be numbered consecutively. In this example, serial interface 1 is assigned the port value 7001, serial interface 2 is assigned the port value 7002, etc. One example on how this could be used is in the case of all.protocol or s<n>.protocol socket_ssh and the port value (7001, 7002, etc), if supplied by the ssh client like username:port value, the ssh client will be directly connected with the serial interface.

**all.protocol**
The possible protocols are telnet, ssh1/ssh2 or raw data:
socket_server = telnet protocol,
socket_ssh = ssh1/ssh2 protocol,
raw_data = used to exchange data in transparent mode. Raw_data is similar to socket_server mode but without telnet negotiation breaks to serial ports.
An example value would be socket_server.

**all.users**
Restricts access to ports by user name (only the users listed can access the port or, using the character “!,” all but the users listed can access the port.) A single comma and spaces/tabs may be used between names. A comma may not appear between the “!” and the first user name. The users may be local, Radius or TacacsPlus. User groups (defined with the parameter conf.group) can be used in combination with user names in the parameter list. Notice that these are common users, not administrators. Example: all.users ! joe, mark, user_group. In this example, the users joe, mark, and members of user_group cannot access the port.
**Chapter 3 - Additional Features**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all.poll_interval</td>
<td>Valid only for protocols socket_server and raw_data. When not set to zero, this parameter sets the wait for a TCP connection keep-alive timer. If no traffic passes through the AlterPath Console Server for this period of time, the AlterPath Console Server will send a line status message to the remote device to see if the connection is still up. If not configured, 1000 ms is assumed (the unit for this parameter is ms). If set to zero, line status messages will not be sent to the socket client.</td>
</tr>
<tr>
<td>all.tx_interval</td>
<td>Valid for protocols socket_server and raw_data. Defines the delay (in milliseconds) before transmission to the Ethernet of data received through a serial port. If not configured, 100ms is assumed. If set to zero or a value above 1000, no buffering will take place.</td>
</tr>
<tr>
<td>all.idletimeout</td>
<td>Valid only for the CAS configuration (protocols socket_server, socket_ssh, and raw_data). Specifies how long (in minutes) a connection can remain inactive before it is cut off. If set to zero (the default), the connection will not time out.</td>
</tr>
<tr>
<td>conf.group</td>
<td>Used to group users to simplify configuration of the parameter all.users later on. This parameter can be used to define more than one group. The format is: &lt;group name&gt;:&lt;user1&gt;{,&lt;user2&gt;[,&lt;user3&gt;]} Example: conf.group group_name: user1, user2.</td>
</tr>
<tr>
<td>s&lt;n&gt;.serverfarm</td>
<td>Alias name given to the server connected to the serial port. Server_connected. Example: s1.serverfarm Server_connected_serial1.</td>
</tr>
</tbody>
</table>

**vi Method**

The parameters described above must be changed by directly editing the /etc/portsave/plsave.conf file.

**Browser Method**

To configure Access Method with your browser:

**Step 1: Point your browser to the ACS.**
In the address or location field of your browser type:

<Console Access Server’s IP address>
Chapter 3 - Additional Features

Step 2: Log in as root and type the Web root password configured by the Web server. This will take you to the Configuration and Administration page.

![Configuration and Administration page](image1)

Figure 15: Configuration and Administration page

Step 3: Select the Serial Ports link.

Click on the Serial Ports link on the Link Panel to the left of the page or in the Configuration section of the page. This will take you to the Port Selection page.

![Port Selection page](image2)

Figure 16: Port Selection page

Step 4: Select port(s).

On the Port Selection page, choose all ports or an individual port from the dropdown menu. This will take you to the Serial Port Configuration page.
Chapter 3 - Additional Features

Step 5: Click the CAS profile button.
Click the CAS profile button in the wizards section. The default CAS profile parameters are now loaded.

Step 6: Scroll down to the Profile section.
You can change the settings for all.ipno, all.socket_port, and all.protocol in this section.

Step 7: Scroll to the Authentication Section.
You can configure the parameter all.users here under Access Restriction on Users.
Chapter 3 - Additional Features

Step 8: Scroll to Console Access Server Section.

You can configure the following parameters here:

- all.sttyCmd
- all.poll_interval
- all.tx_interval
- all.idletimeout

Step 9: Configure s<n>.serverfarm.

This parameter will not appear on the configuration page when “All ports” is selected. Scroll to the SSH section. Each port can be named after the server or device connected to it. This makes the process of associating what is connecting to which port easier.

Step 10: Click the Submit button.

This will take you back to the Port Selection page. At this point, the configuration file is written in the RAMdisk.

Step 11: Click on the Serial Port Groups link on the Link Panel.

Click the Add Group button that appears. A Serial Ports - Users Group Table Entry page appears.

![Add Serial Ports - Users Group Table Entry](image)

Figure 19: Serial Ports - Users Group Table Entry page

Step 12: Configure conf.group.

Fill in the Group Name and Users fields to configure the group.
Chapter 3 - Additional Features

Step 13: Click the Submit button.
At this point, the configuration file is written in the RAMdisk.

Step 14: Make the changes effective.
Click on the Administration > Run Configuration link, check the Serial Ports/
Ethernet/Static Routes box and click on the Activate Configuration button.

Step 15: Save it in the flash.
Go to the link Administration > Load/Save Configuration and click the Save to Flash
button.

Wizard Method

Step 1: Bring up the wizard.
At the command prompt, type the following to bring up the Access Method custom
wizard:

wiz --ac cas

This will bring up Screen 1:

Screen 1:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************
INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system
and press ENTER. Enter '#' if you want to
deactivate that parameter or
2) Press ENTER if you are satisfied with the value
within the brackets [ ] and want to go on to the
next parameter or
3) Press ESC if you want to exit.

NOTE: For some parameters, if there is nothing within
Chapter 3 - Additional Features

the brackets, it will continue to ask for a value. In that case, you must enter a valid value or # if you do not wish to configure the value.

Press ENTER to continue...

Screen 2:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

Current configuration:
(The ones with the '#' means it's not activated.)

all.ipno : #
all.socket_port : 7001+
all.protocol : socket_server
all.users : #
all.poll_interval : #
all.tx_interval : #
all.idletimeout : #
conf.group : #

Set to defaults? (y/n) [n] :

Screen 3:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

ALL.IPNO - This is the default IP address of the system's serial ports. If configured as 192.168.1.101+, the '+' indicates that the first port should be addressed as 192.168.1.101 and the following ports should have consecutive values. Any host can access a port using its IP address as long as a path to the address exists
Chapter 3 - Additional Features

in the host's routing table.

all.ipno[#] :

ALL.SOCKE T_PORT - This defines an alternative labeling system for the system ports. The '+' after the numerical value causes the interfaces (or ports) to be numbered consecutively.
(e.g. interface 1 of your system is assigned port 7001, interface 2 has the value 7002, etc.)

all.socket_port[7001+] :

Screen 4:

***********************************************************
********* CONFIGURATION WIZARD ***********************
***********************************************************

ALL.PROTOCOL - The possible protocols are telnet, ssh1/ssh2, or raw data.
(e.g. socket_server -telnet protocol, socket_ssh -ssh1/ssh2 protocol, raw_data -used to exchange data in transparent mode; similar to socket_server mode but without telnet negotiation breaks to serial ports.)

all.protocol[socket_server] :

ALL.USERS - Restricts access to ports by user name. Only the users listed can access the port, or using a '!', all but the users listed can access the port.
A single comma and spaces/tabs may be used between names. A comma may NOT appear between the '!' and the first user name. The users may be local, Radius or TacacsPlus. User groups (defined with the parameter conf.group) can be used in combination with user names in the parameter list. Notice that these are common users, not administrators.
(e.g. !joe, mark, grp1 - the users, Joe, Mark, and members of grp1, cannot access the port.)

all.users[#] :

Screen 5:

*******************************************************************************
******** CONFIGURATION WIZARD ********
*******************************************************************************

ALL.POLL_INTERVAL - Valid for protocols socket_server and raw_data. When not set to 0, this parameter sets the wait for a TCP connection keep-alive timer. If no traffic passes through the system for this period of time, the system will send a line status message to the remote device to see if the connection is still up. If not configured, default is 1000ms. If set to 0, line status messages will not be sent to the socket client.

all.poll_interval[#] :

ALL.TX_INTERVAL - Valid for protocols socket_server and raw_data. This parameter defines the delay (in milliseconds) before transmission to the Ethernet of data received through a serial port. If not configured, 100ms is assumed. If set to 0 or a value above 1000, no buffering will take place.

all.tx_interval[#] :
Screen 6:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

ALL.IDLETIMEOUT - This parameter specifies how long (in minutes) a connection can remain inactive before it is cut off. If set to 0 (the default), the connection will not time out.

all.idletimeout[#] :

CONF.GROUP - Used to combine users into a group. This simplifies the parameter, all.users. You can define more than one group. (e.g. groupName: user1, user2)

conf.group[#] : sales: john, jane

Would you like to create another group? (y/n) [n] :

Screen 7:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

Current configuration:
(The ones with the '#' means it's not activated.)

all.ipno : #
all.socket_port : 7001+
all.protocol : socket_server
all.users : #
all.poll_interval : #
all.tx_interval : #
all.idletimeout : #
conf.group : #

Are these configuration(s) all correct? (y/n) [n]:

Chapter 3 - Additional Features

If you type 'n':

Type 'c' to go back and CORRECT these parameters or 'q' to QUIT :

Typing 'c' repeats the application, typing 'q' exits the entire wiz application.

If you type 'y':

Discard previous port-specific parameters? (y/n) [n] :

Note: Answering yes to this question will discard only the parameter(s) which you are currently configuring if they were configured for a specific port in a previous session. For instance, if you are currently configuring parameter, all.x, and there was a specific port, s2.x, configured; then, answering yes to this question will discard s2.x.

Type 'c' to CONTINUE to set these parameters for specific ports or 'q' to QUIT :

Typing 'c' leads to Screen 8, typing 'q' leads to Screen 9.

Screen 8:
***********************************************************
*********CONFIGURATION WIZARD *********
***********************************************************

You have 8 available ports on this system.

Type 'q' to quit, a valid port number[1-8], or anything else to refresh :
Chapter 3 - Additional Features

Note: The number of available ports depends on the system you are on. Typing in a valid port number repeats this program except this time it's configuring for the port number you have chosen. For "wiz -ac cas," an additional parameter is asked: serverfarm. Typing 'q' leads to Screen 9.

Screen 9:

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

(Note: If you are NOT connected to this unit through a console, and you have just reconfigured the IP of this unit, activating the new configurations may cause you to lose connection. In that case, please reconnect to the unit by the new IP address, and manually issue a saveconf to save your configurations to flash.)

Do you want to activate your configurations now? (y/n) [y] :

Screen 10:

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

Flash refers to a type of memory that can be erased and reprogrammed in units of memory known as blocks rather than one byte at a time; thus, making updating to memory easier.

If you choose to save to flash, your configurations thus far will still be in the memory of the system even after you reboot it. If you don't save to flash and if you were to reboot the system, all your new configurations will be lost.
and you will have to reconfigure the system.

Do you want to save your configurations to flash? (y/n) [n] :

CLI Method

To configure certain parameters for a specific serial port:

Step 1: **At the command prompt, type in the appropriate command to configure desired parameters.**

To activate the serial port. `<string>` should be ttyS<serial port number>:

```
config configure line <serial port number> tty <string>
```

To configure the ipno:

```
config configure line <serial port number> ipno <string>
```

To configure the socket_port:

```
config configure line <serial port number> socket <number>
```

To configure the protocol. `<string>` is the type of protocol desired:

```
config configure line <serial port number> protocol <string>
```

To configure modbus_smode:

```
config configure line <serial port number> modbus <string>
```

To configure users:

```
config configure line <serial port number> users <string>
```

To configure the poll_interval:

```
config configure line <serial port number> pollinterval <number>
```
Chapter 3 - Additional Features

To configure tx_interval:

\[ \text{config configure line <serial port number> txinterval <number>} \]

To configure idletimeout:

\[ \text{config configure line <serial port number> idletimeout <number>} \]

To configure conf.group:

\[ \text{config configure conf group <string>} \]

**Tip.** You can configure all the parameters for a serial port in one line.

\[ \text{config configure line <serial port number> tty <string> ipno <string> socket <number> protocol <string> modbus <string> users <string> pollinterval <number> txinterval <number> idletimeout <number>} \]

**Step 2: Activate and Save.**

To activate your new configurations and save them to flash, type:

\[ \text{config write} \]

(This is essentially typing signal_ras hup and saveconf from the normal terminal prompt.)
Chapter 3 - Additional Features

Configuration for TS

Parameters and Passed Values
For TS configuration, you will need to configure the following parameters:

- **all.host**: The IP address of the host to which the terminals will connect.
- **all.protocol**: For the terminal server configuration, the possible protocols are login (which requests username and password), rlogin (receives username from the ACS and requests a password), telnet, ssh, ssh2, or socket_client. If the protocol is configured as telnet or socket_client, the parameter socket_port needs to be configured.
- **all.socket_port**: This parameter is valid only if all.protocol is configured as socket_client or telnet. The socket_port is the TCP port number of the application that will accept connections requested by this serial port.
- **all.telnet_client_mode**: When the protocol is TELNET, this parameter configured as BINARY (1) causes an attempt to negotiate the TELNET BINARY option on both input and output with the Telnet server. So it puts the telnet client in binary mode. The acceptable values are "0" or "1", where "0" is text mode (default) and "1" is a binary mode.
- **all.userauto** (unique to TS): Username used when connected to a UNIX server from the user's serial terminal.

**vi Method**
The parameters described above must be changed by directly editing the /etc/portsave/psave.conf file.

**Browser Method**

**Step 1**: Follow the steps 1 to 4 in the section titled Configuration for CAS, "Browser Method" on page 73.
Chapter 3 - Additional Features

Step 2: Click the TS Profile button in the Wizard section.
Configure the following parameters:

Profile section: Protocol (telnet, ssh, rlogin or socket client)
Socket port (23 for telnet, 22 for ssh, 513 for rlogin)

Terminal Server section: Host (the name or the IP address of the host)
Automatic User

Step 3: Click the Submit button.
At this point, the configuration file is written in the RAMdisk.

Step 4: Make changes effective.
Click on the Administration > Run Configuration link, check the Serial Ports/
Ethernet/Static Routes box and click on the Activate Configuration button.

Step 5: Save it in the flash.
Go to the link Administration > Load/Save Configuration and click the Save to Flash
button.

Wizard Method

Step 1: Bring up the wizard.
At the command prompt, type the following to bring up the Access Method custom
wizard:

wiz --ac ts

This will bring up Screen 1:
Chapter 3 - Additional Features

Screen 1:

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system and press ENTER. Enter '#' if you want to deactivate that parameter or  
2) Press ENTER if you are satisfied with the value within the brackets [ ] and want to go on to the next parameter or  
3) Press ESC if you want to exit.

NOTE: For some parameters, if there is nothing within the brackets, it will continue to ask for a value. In that case, you must enter a valid value or # if you do not wish to configure the value.

Press ENTER to continue...

Screen 2:

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

Current configuration:
(The ones with the '#' means it's not activated.)

all.protocol : rlogin

Do you want to save your configurations to flash? (y/n) [n] :
Chapter 3 - Additional Features

CLI Method
To configure certain parameters for a specific serial port:

**Step 1:** At the command prompt, type in the appropriate command to configure desired parameters.

To activate the serial port. `<string>` should be `ttyS<serial port number>`:

```
config configure line <serial port number> tty <string>
```

To configure the protocol (`<string>` is the type of protocol desired):

```
config configure line <serial port number> protocol <string>
```

To configure the socket port:

```
config configure line <serial port number> socket <number>
```

To configure the telnet_client_mode:

```
config configure line <serial port number> telnetclientmode <number>
```

To configure userauto:

```
config configure line <serial port number> userauto <string>
```

**Tip.** You can configure all the parameters for a serial port in one line.

```
config configure line <serial port number> tty <string>
protocol <string> socket <number> telnetclientmode <number> userauto <string>
```

**Step 2:** Activate and Save.

To activate your new configurations and save them to flash, type:

```
config write
```

(This is essentially typing `signal_ras hup` and `saveconf` from the normal terminal prompt.)
Chapter 3 - Additional Features

Configuration for Dial-in Access

Parameters and Passed Values

The parameters that need to be configured are shown in the following list. Note: The character "\" at the end of a line means that the string continues on the next line.

- **conf.pppd**: Location of the ppp daemon with Radius. Default value: /usr/local/sbin/pppd.

- **all.ipno**: This is the default IP address of the AlterPath Console Server’s serial ports. Any host can access a port using its IP address as long as a path to the address exists in the host’s routing table. An example value would be 192.168.1.101+. The "+" indicates that the first port should be addressed as 192.168.1.101 and the following ports should have consecutive values.

- **all.initchat**: Modem initialization string. Example value:
  
  ```
  TIMEOUT 10 "\”\d\l\DATZ \OK\n-ATZ-OK\n "\” \ATMO OK\n \n "\” \n\n
  STATUS Incoming %p:I.HANDSHAKE ""\n  TIMEOUT 3600 RING ""\n
  STATUS Connected %p:I.HANDSHAKE
  ```

- **all.autoppo**: Options to auto-detect a ppp session. The cb-script parameter defines the file used for callback and enables negotiation with the callback server. Callback is available in combination with Radius Server authentication. When a registered user calls the AlterPath Console Server, it will disconnect the user, then call the user back. The following three parameters must be configured in the Radius Server.
  
  - attribute Service_type(6): Callback Framed;
  
  - attribute Framed_Protocol(7): PPP;
  
  - attribute Callback_Number(19): the dial number (example: 50903300).
Chapter 3 - Additional Features

Example value:
%j novj \nproxyarp modem asyncmap 000A.0000 \nnoipx nocc login auth require-pap refusechap\nmtu %t mru %t \ncb-script /etc/ports/pslave/cb_script \nplugin /usr/lib/libpsr.so

all.pppopt  PPP options when user has already been authenticated.
Example value:
%i:%j novj \nproxyarp modem asyncmap 000A.0000 \nnoipx nocc mtu %t mru %t netmask %m \nidle %t maxconnect %t \nplugin /usr/lib/libpsr.so

all.protocol  For the Dial-in configuration, the available protocols are PPP, SLIP and CSLIP.

Tip. Documentation about PPP options can be found on the Linux pppd man page.

vi Method
The parameters described above must be changed by directly editing the
/etc/ports/pslave/conf file.

Browser Method
For the serial ports you would have all the parameters described above but conf.*.
To configure Access Method with your browser:

Step 1: Follow the steps 1 to 4 in the section titled Configuration for CAS, “Browser Method” on page 73.

Step 2: Click the Dial in Profile button in the Wizard section.

Step 3: Scroll down to the Profile section.
Chapter 3 - Additional Features

You can change the settings for all.ipno and all.protocol in this section.

Step 4: Scroll to the modem Section.
You can configure the parameter all.initchat here.

Step 5: Scroll to the PPP Section.
You can configure the parameter all.autoppp and all.pppopt here.

Step 6: Click the Submit button.
At this point, the configuration file is written in the RAMdisk.

Step 7: Make the changes effective.
Click on the Administration > Run Configuration link, check the Serial Ports/Ethernet/Static Routes box and click on the Activate Configuration button.

Step 8: Save it in the flash.
Go to the link Administration > Load/Save Configuration and click the Save to Flash button.

CLI Method
To configure certain parameters for a specific serial port:

Step 1: At the command prompt, type in the appropriate command to configure desired parameters.
To activate the serial port. <string> should be ttyS<serial port number>:

```
config configure line <serial port number> tty <string>
```

To configure the protocol. <string> is the type of protocol desired:

```
config configure line <serial port number> protocol <string>
```

To configure ipno:

```
config configure line <serial port number> ipno <string>
```
Chapter 3 - Additional Features

**Tip.** You can configure all the parameters for a serial port in one line.

```
config configure line <serial port number> tty <string>
protocol <string> ipno <string>
```

**Step 2: Activate and Save.**

To activate your new configurations and save them to flash, type:

```
config write
```

(This is essentially typing `signal_ras hup` and `saveconf` from the normal terminal prompt.)

---

**Authentication**

Authentication is the process of identifying an individual, usually based on a username and password. In security systems, authentication is distinct from authorization, which is the process of giving individuals access to system objects based on their identity. Authentication merely ensures that the individual is who he or she claims to be, but says nothing about the access rights of the individual. With the AlterPath Console Server, authentication can be performed locally, or with a remote Radius, Tacacs, or ldap database, or kerberos.

**Parameters Involved and Passed Values**

The authentication feature utilizes the following parameters:
all.authtype  Type of authentication used. There are several authentication type options:

- **none** (no authentication)
- **local** (authentication is performed using the /etc/passwd file)
- **remote** (This is for a terminal profile only. The unit takes in a user-name but does not use it for authentication. Instead it passes it to the remote server where it is then used for authentication.)
- **radius** (authentication is performed using a Radius authentication server)
- **TacacsPlus** (authentication is performed using a TacacsPlus authentication server)
- **ldap** (authentication is performed against an Ldap database using an Ldap server. The IP address and other details of the Ldap server are defined in the file /etc/ldap.conf)
- **kerberos** (authentication is performed using a kerberos server. The IP address and other details of the kerberos server are defined in the file /etc/krb5.conf)
- **local/radius** (authentication is performed locally first, switching to Radius if unsuccessful)
- **radius/local** (the opposite of the previous option)
- **local/TacacsPlus** (authentication is performed locally first, switching to TacacsPlus if unsuccessful)
- **TacacsPlus/local** (the opposite of the previous option)
- **RadiusDownLocal** (local authentication is tried only when the Radius server is down)
- **TacacsPlusDownLocal** (local authentication is tried only when the TacacsPlus server is down)
### Chapter 3 - Additional Features

<table>

</tr>
<tr>
<td>all.radretries</td>
<td>Defines the number of times each Radius/ TacacsPlus server is tried before another is contacted. The first server (authhost1) is tried &quot;radretries&quot; times, and then the second (authhost2), if configured, is contacted &quot;radretries&quot; times. If the second also fails to respond, Radius/ TacacsPlus authentication fails.</td>
</tr>
<tr>
<td>all.secret</td>
<td>This is the shared secret (password) necessary for communication between the AlterPath Console Server and the Radius/TacacsPlus servers.</td>
</tr>
</tbody>
</table>
Note: If you want to dial in to the serial port on an ACS series with CHAP authentication, you need to do the following:

1. Configure Sxx.authtype as local.
2. Add users in ACS.
3. Insert the users in the file /etc/ppp/chap-secrets.
4. Insert the file /etc/ppp/chap-secrets in the file /etc/config_files.
5. Execute the saveconf command.

Configuration for CAS, TS, and Dial-in Access

vi Method
The parameters described above must be changed by directly editing the /etc/portslave/pslave.conf file.

Browser Method
To configure Authentication with your browser:

Step 1: Follow the steps 1 to 4 in the section titled Configuration for CAS, “Browser Method” on page 73.

Step 2: Scroll to the Authentication section.
Scroll down to the Authentication section and configure the parameters in this section.

Step 3: Click the Submit button.
At this point, the configuration file is written in the RAMdisk.

Step 4: Make changes effective.
Click on the Administration > Run Configuration link, check the Serial Ports/Ethernet/Static Routes box and click on the Activate Configuration button.
Chapter 3 - Additional Features

Step 5: Save it in the flash.
Go to the link Administration > Load/Save Configuration and click the Save to Flash button.

Wizard Method

Step 1: Bring up the wizard.
At the command prompt, type the following to bring up the Authentication custom wizard:

```
    wiz --auth
```
Screen 1 will appear.

**Screen 1:**

***********************************************************
******** *CONFIGURATION WIZARD *********

******** **CONFIGURATION WIZARD **********
***********************************************************

ALL.AUTHTYPE - This parameter controls the authentication required by the system. Users' access to the server through the serial port is granted through the check of username and password locally or remotely. (e.g. none, local, TacacsPlus (note the capital 'T' in TacacsPlus), radius, ldap, kerberos, etc.

all.authtype[none] :
Chapter 3 - Additional Features

**Note:** If authtype is configured as “none,” “local,” “ldap,” or “kerberos” the application will skip immediately to the summary screen because the rest of the parameters pertain only if the system is configured to use a Radius or TacacsPlus server. Configurations for ldap and kerberos are done in /etc/ldap.conf and /etc/krb5.conf, respectively.

ALL.AUTHHOST1 - This IP address indicates where the Radius or TacacsPlus authentication server is located.

all.authhost1[200.200.200.2] :

ALL.ACCTHOST1 - This IP address indicates where the Radius or TacacsPlus accounting server is located. The accounting server can be used to track how long users are connected after being authorized by the authentication server.

all.accthost1[200.200.200.3] :

ALL.AUTHHOST2 - This IP address indicates where the SECOND Radius or TacacsPlus authentication server is located.

all.authhost2[200.200.200.2] :
ALL.ACCTHOST2 - This IP address indicates where the SECOND Radius or TacacsPlus accounting server is located.

all.accthost2[200.200.200.3] :

ALL.RADTIMEOUT - This is the timeout (in seconds) for a Radius or TacacsPlus authentication query to be answered.

all.radtimeout[3] :

ALL.RADRETRIES - This defines the number of times each Radius or TacacsPlus server is tried before another is contacted.

all.radretries[5] :

ALL.SECRET - This is the shared secret necessary for communication between the system and the Radius or TacacsPlus servers.

all.secret[secret] :
Chapter 3 - Additional Features

Screen 7:
***********************************************************
********** CONFIGURATION WIZARD **********
***********************************************************
Current configuration:
(The ones with the '#' means it's not activated.)

all.authtype : none
all.authhost1 : 200.200.200.2
all.accthost1 : 200.200.200.3
all.authhost2 : 200.200.200.2
all.accthost2 : 200.200.200.3
all.radtimeout : 3
all.radretries : 5
all.secret : rad-secret

Are these configuration(s) all correct? (y/n) [n] :

If you type 'n'
Type 'c' to go back and CORRECT these parameters or 'q' to QUIT :
Typing 'c' repeats application, typing 'q' exits the entire wiz application

If you type 'y'
Discard previous port-specific parameters? (y/n) [n] :

Note: Answering yes to this question will discard only the parameter(s) which you are currently configuring if they were configured for a specific port in a previous session. For instance, if you are currently configuring parameter, all.x, and there was a specific port, s2.x, configured; then, answering yes to this question will discard s2.x.

Type 'c' to CONTINUE to set these parameters for specific ports or 'q' to QUIT :

Typing 'c' leads to Screen 8, typing 'q' leads to Screen 9.
Chapter 3 - Additional Features

Screen 8:
***********************************************************
*********** CONFIGURATION WIZARD ***********
***********************************************************
You have 8 available ports on this system.

Type 'q' to quit, a valid port number[1-8], or anything else to refresh :

Note: The number of available ports depends on the system you are on. Typing in a valid port number repeats this program except this time it's configuring for the port number you have chosen. Typing 'q' leads to Screen 9.

Screen 9:
***********************************************************
*********** CONFIGURATION WIZARD ***********
***********************************************************

(Note: If you are NOT connected to this unit through a console, and you have just reconfigured the IP of this unit, activating the new configurations may cause you to lose connection. In that case, please reconnect to the unit by the new IP address, and manually issue a saveconf to save your configurations to flash.)

Do you want to activate your configurations now? (y/n) [y] :
Chapter 3 - Additional Features

Screen 10:
***********************************************************
********* CONFIGURATION WIZARD *********
***********************************************************

Flash refers to a type of memory that can be erased and reprogrammed in units of memory known as blocks rather than one byte at a time; thus, making updating to memory easier.

If you choose to save to flash, your configurations thus far will still be in the memory of the system even after you reboot it. If you don't save to flash and if you were to reboot the system, all your new configurations will be lost and you will have to reconfigure the system.

Do you want to save your configurations to flash? (y/n) [n] :

CLI Method
To configure certain parameters for a specific serial port.

Step 1: At the command prompt, type in the appropriate command to configure desired parameters.
To activate the serial port. <string> should be ttyS<serial port number>:

config configure line <serial port number> tty <string>

To configure authtype:

config configure line <serial port number> authtype <string>

To configure authhost1:

config configure line <serial port number> authhost1 <string>

To configure accthost1:

config configure line <serial port number> accthost1 <string>
Chapter 3 - Additional Features

To configure authhost2:

```bash
config configure line <serial port number> authhost2 <string>
```

To configure accthost2:

```bash
config configure line <serial port number> accthost2 <string>
```

To configure radtimeout:

```bash
config configure line <serial port number> timeout <number>
```

To configure radretries:

```bash
config configure line <serial port number> retries <number>
```

To configure secret:

```bash
config configure line <serial port number> secret <string>
```

Tip. You can configure all the parameters for a serial port in one line.

```bash
config configure line <serial port number> tty <string> authtype <string> authhost1 <string> accthost1 <string> authhost2 <string> accthost2 <string> timeout <number> retries <number> secret <string>
```

Step 2: Activate and Save.

To activate your new configurations and save them to flash, type:

```bash
config write
```
Chapter 3 - Additional Features

Clustering

Clustering is available for the AlterPath Console Server with firmware versions 2.1.0 and up. It allows the stringing of Terminal Servers so that one master AlterPath Console Server can be used to access all AlterPath Console Servers on a LAN. The master AlterPath Console Server can manage up to 512 serial ports, so that the following can be clustered:

- 1 Master ACS48 + 10 slave ACS48s + 1 slave ACS32, or
- 1 Master ACS16 + 31 slave ACS16s, or
- 1 Master ACS32 + 15 slave ACS32s

An example with one master ACS32 and two slave ACS16s is shown in the following figure.

![Figure 20: An example using the Clustering feature](image)
Parameters Involved and Passed Values

The Master AlterPath Console Server must contain references to the Slave ports. The configuration described earlier for Console Access Servers should be followed with the following exceptions for the Master and Slaves:

**Table 7: Master Cyclades Configuration (where it differs from the CAS standard)**

</tr>
<tr>
<td>all.authtype</td>
<td>none</td>
</tr>
<tr>
<td>all.socket_port</td>
<td>7301+</td>
</tr>
</tbody>
</table>
To access ports from the remote management workstation, use telnet with the secondary IP address:

telnet 209.81.55.110 7001
to access the first port of the Master AlterPath Console Server.
telnet 209.81.55.110 7033
to access the first port of Slave 1.
telnet 209.81.55.110 7065
to access the first port of Slave 2.

Ssh can also be used from the remote management workstation:

ssh -l <username>:Server_on_slave2_serial_s3 209.81.55.110
to access the third port of Slave 2, or
ssh -l <username>:7069 209.81.55.110
to access the fifth port of Slave 2.

Centralized Management - the Include File

The AlterPath Console Server allows centralized management through the use of a master pslave.conf file. Administrators should consider this approach to configure multiple AlterPath Console Server. Using this feature, each unit has a simplified pslave.conf file where a master include file is cited. This common configuration file contains information for all units, properly divided in separate sections, and would be stored on one central server. This file, in our example shown in Figure 21: Example of Centralized Management, is /etc/portsave/TScommon.conf. It must be downloaded to each AlterPath Console Server.
The abbreviated pslave.conf and /etc/hostname files in each unit, for the example are:

For the /etc/hostname file in unit 1:

unit1

For the pslave.conf file in unit 1:

conf.eth_ip 10.0.0.1
conf.eth_mask 255.0.0.0
conf.include /etc/portslave/TScommon.conf

For the /etc/hostname file in unit 2:

unit2

For the pslave.conf file in unit 2:

conf.eth_ip 10.0.0.2
conf.eth_mask 255.0.0.0
conf.include /etc/portslave/TScommon.conf
Chapter 3 - Additional Features

For the /etc/hostname file in unit 3:

unit3

For the pslave.conf file in unit 3:

conf.eth_ip 10.0.0.3
conf.eth_mask 255.0.0.0
conf.include /etc/portslave/TScommon.conf

The common include file for the example is:

conf.host_config unit1
<parameters for unit1 following the rules for pslave.conf>
conf.host_config unit2
<parameters for unit2 following the rules for pslave.conf>
conf.host_config unit3
<parameters for unit3 following the rules for pslave.conf>
conf.host_config.end

When this file is included, unit1 would read only the information between
conf.host_config unit1 and conf.host_config unit2. Unit2 would use only the information
between conf.host_config unit2 and conf.host_config unit3 and unit3 would use information
after conf.host_config unit3 and before conf.host_config.end.

Steps for using Centralized Configuration

Step 1: Create and save the /etc/portslave/pslave.conf and /etc/hostname files in each
AlterPath Console Server.

Step 2: Execute the command signal_ras hup on each unit.
Chapter 3 - Additional Features

Step 3: Create, save, and download the common configuration.
Create and save the common configuration file on the server, then download it (probably using scp) to each unit. Make sure to put it in the directory set in the pslave.conf file (/etc/pslave in the example).

Step 4: Execute the command signal_ras hup on each unit again.

Step 5: Test each unit.
If everything works, add the line /etc/pslave/TScustom.conf to the /etc/config_files file.

Step 6: Save the file and close it.

Step 7: Execute the saveconf command.

Note: The included file /etc/pslave/TScustom.conf cannot contain another include file (i.e., the parameter conf.include must not be defined).

Also, <max ports of ACS> + N(+) is done same way as serial port.

CronD

CronD is a service provided by the AlterPath Console Server system that allows automatic, periodically-run custom-made scripts. It replaces the need for the same commands to be run manually.

Parameters Involved and Passed Values
The following parameters are created in the /etc/crontab_files file:

- **status**: Active or inactive. If this item is not active, the script will not be executed.
- **user**: The process will be run with the privileges of this user, who must be a valid local user.

116 AlterPath Console Server
Chapter 3 - Additional Features

source Pathname of the crontab file that specifies frequency of execution, the name of shell script, etc. It should be set using the traditional crontab file format.

Example:
The name of the shell script with the commands to be executed is /etc/teste_cron.sh.
The name of the crontab file is /etc/crontab_tst and it contains one line:

0-59 * * * * /etc/test_cron.sh

Insert the following line in the /etc/crontab_files:

active root /etc/crontab_tst

Result: CronD will execute the shell script teste_cron.sh with root privileges each minute.

Note: In /etc/crontab, you can only have one active entry per user. For instance, from the example above, you cannot add another active entry for root because it already has an entry. If you want to add more scripts, you can just add them to the source file (/etc/crontab_tst).

Configuration for CAS, TS, and Dial-in Access

Important! After creating the shell script and crontab file and modifying the crontab_files file, make sure the file named /etc/config_files contains the names of all files that should be saved to flash. Run the command saveconf after this confirmation.

vi Method
The files Crontab and shell script are created and the file /etc/crontab_files is modified as indicated.
Chapter 3 - Additional Features

To use cronD:

**Step 1:** Create the files for every process that it will execute:

**Step 2:** Create a line in the file `/etc/crontab_files` for each process to be run.

**Step 3:** Update the system.
   - The next step is to update the system with the modified data. Make sure the file named `/etc/config_files` contains the names of all files that should be saved to flash.

**Step 4:** Run `saveconf`.
   - The command `saveconf`, which reads the `/etc/config_files` file, should then be run. `saveconf` copies all the files listed in the file `/etc/config_files` from the ramdisk to `/proc/flash/script`.

**Step 5:** Reboot the AlterPath Console Server.

**Browser Method**
To configure CronD with your browser:

**Step 1:** Point your browser to the ACS.
   - In the address or location field of your browser type:
     
     `<Console Access Server’s IP address>`

**Step 2:** Log in as root and type the Web root password configured by the Web server.
   - This will take you to the Configuration and Administration page.

**Step 3:** Click on the Edit Text File link.
   - Click on this link on the Link Panel. You can then pull up the appropriate file and edit it.
Chapter 3 - Additional Features

Data Buffering

Introduction

Data buffering can be done in local files or in remote files through NFS. When using remote files, the limitation is imposed by the remote Server (disk/partition space) and the data is kept in linear (sequential) files in the remote Server. When using local files, the limitation is imposed by the size of the available ramdisk. You may wish to have data buffering done in file, syslog or both. For syslog, all.syslog_buffering and conf.DB_facility are the parameters to be dealt with, and syslog-ng.conf file should be set accordingly. (Please see Syslog for the syslog-ng configuration file.) For the file, all.data_buffering is the parameter to be dealt with.

Conf.nfs_data_buffering is a remote network file system where data buffering will be written, instead of using the default directory /var/run/DB. When commented, it indicates local data buffering. The directory tree to which the file will be written must be NFS-mounted and the local path name is /mnt/DB_nfs. The remote host must have NFS installed and the administrator must create, export, and allow reading/writing to this directory. The size of this file is not limited by the value of the parameter s1.data_buffering, though the value cannot be zero since a zero value turns off data buffering.

The conf.nfs_data_buffering parameter format is:

<server name or IP address>:<remote pathname>

If data buffering is turned on for port 1, for example, the data will be stored in the file ttyS1.data (or &lt;serverfarm1&gt;:data if s1.serverfarm was configured) in local directory /var/run/DB or in remote path name and server indicated by the conf.nfs_data_buffering.
Chapter 3 - Additional Features

Ramdisks
Data buffering files are created in the directory /var/run/DB. If the parameter ss<nn>.serverfarm is configured for the port <nn>, this name will be used. For example, if the serverfarm is called bunny, the data buffering file will be named bunny.data.

The shell script /bin/build_DB_ramdisk creates a 48 Mbyte ramdisk for the ACS. Use this script as a model to create customized ramdisks for your environment. Any user-created scripts should be listed in the file /etc/user_scripts because rc.sysinit executes all shell scripts found there. This avoids changing rc.sysinit itself.

Linear vs. Circular Buffering
For local data buffering, this parameter allow users to buffer data in either a circular or linear fashion. Circular format (cir) is a revolving buffer file that is overwritten whenever the limit of the buffer size (set by all.data_buffering) is reached. In linear format (lin), data transmission between the remote device and the serial port ceases once the 4k bytes Rx buffer in the kernel is reached. Then if a session is established to the serial port, the data in the buffer is shown (dont_show_DBmenu must be 2), cleared, and data transmission is resumed. Linear buffering is impossible if flow control is set to none. Default is cir.

Parameters Involved and Passed Values
Data Buffering uses the following parameters:

all.data_buffering A non zero value activates data buffering (local or remote, according to what was configured in the parameter conf.nfs_data_buffering). If local data buffering, a file is created on the AlterPath Console Server; if remote, a file is created through NFS in a remote server. All data received from the port is captured in this file. If local data buffering, this parameter means the maximum file size (in bytes). If remote, this parameter is just a flag to activate (greater than zero) or deactivate data buffering. When local data buffering is used, each time the maximum is reached the oldest 10% of stored data is discarded, releasing space for new data (FIFO system) - circular file. When remote data
buffering is used, there’s no maximum file size other than
the one imposed by the remote server - linear file. This file
can be viewed using the normal UNIX tools (cat, vi, more,
etc.). Size is in bytes not kilobytes.

conf.nfs_data_buffering

This is the Remote Network File System where data cap-
tured from the serial port will be written instead of being
written to the local directory /var/run/ DB. The directory
tree to which the file will be written must be NFS-
mounted, so the remote host must have NFS installed and
the administrator must create, export and allow reading/ writing to this directory. The size of this file is not limited
by the value of the parameter all.data_buffering, though
the value cannot be zero since a zero value turns off data
buffering. The size of the file is dependent on the NFS
server only (hard drive, partition size, etc.).

all.DB_mode

When configured as cir for circular format, the buffer is
like a revolving file that is overwritten whenever the limit
of the buffer size (as configured in all.data_buffering or
s<n>.data_buffering) is reached. When configured as lin
for linear format, once 4k bytes of the Rx buffer in the ker-
nel is reached, a flow control stop (RTS off or XOFF-
depending on how all.flow or s<n>.flow is set) is issued to
prevent the serial port from receiving further data from
the remote. Then when a session is established to the
serial port, a flow control start (RTS on or XON) will be
issued and data reception will then resume. If all.flow or
s<n>.flow is set to none, linear buffering isn’t possible.
Default is cir.

all.syslog_buffering

When nonzero, the contents of the data buffer are sent to
the syslog-ng every time a quantity of data equal to this
parameter is collected. The syslog level for data buffering
is hard coded to level 5 (notice) and facility is local plus
conf.DB_facility. The file /etc/syslog-ng/syslog-ng.conf
should be set accordingly for the syslog-ng to take some
action.
Chapter 3 - Additional Features

all.syslog_sess  This parameter determines whether syslog is generated when a user is connected to the port or not. Originally, syslog is always generated whether the user is connected to the port or not. Now, users have the option to NOT have syslog generate messages when they connect to a port. This feature does not affect the local data_buffering file. When set to 0 (default), syslog is always generated. When set to 1, syslog is only generated when the user is NOT connected to the port sending the data. When the user does connect to the port that is sending data, syslog messages won't be generated.

all.dont_show_DBmenu  When zero, a menu with data buffering options is shown when a nonempty data buffering file is found. When 1, the data buffering menu is not shown. When 2, the data buffering menu is not shown but the data buffering file is shown if not empty. When 3, the data buffering menu is shown, but without the erase and show and erase options.

all.DB_timestamp  Records the time stamp in the data buffering file (1) or not (0). If it is configured as 1, the software will accumulate input characters until it receives a CR and LF from the serial port or the accumulated data reaches 256 characters. Either way, the accumulated data will be recorded in the data buffering file along with the current time. The parameter all.data_buffering has to be with a non-zero value for this parameter to be meaningful.

Configuration for CAS

vi Method

Files to be modified:

- pslave.conf
- syslog-ng.conf

AlterPath Console Server
Chapter 3 - Additional Features

Browser Method
To configure Data Buffering with your browser:

**Step 1:** Point your browser to the ACS.
In the address or location field of your browser type:

<Console Access Server’s IP address>

**Step 2:** Log in as root and type the Web root password configured by the Web server.
This will take you to the Configuration and Administration page.

**Step 3:** Select the Serial Ports link.
Click on the Serial Ports link on the Link Panel to the left of the page or in the Configuration section of the page. This will take you to the Port Selection page.

**Step 4:** Select port(s).
On the Port Selection page, choose all ports or an individual port to configure, from the dropdown menu. Click the Submit button. This will take you to the Serial Port Configuration page.

**Step 5:** Scroll down to the Data Buffering section.
You can change the settings in this section.

<table>
<thead>
<tr>
<th>Data Buffering</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum Buffer Size (0:disabled): 0</td>
</tr>
<tr>
<td>Data Buffering Mode:</td>
</tr>
<tr>

</tr>
<tr>
<td>Syslog Buffering at all times:</td>
</tr>
<tr>
<td>Data Buffering Menu:</td>
</tr>
<tr>
<td>Alarm for Data Buffering:</td>
</tr>
</tbody>
</table>

Figure 23: Data Buffering section of the Serial Port Configuration page
Chapter 3 - Additional Features

Step 6: Click the Submit button.

Step 7: Select the General link.
Click on the General link on the Link Panel to the left of the page.

Step 8: Scroll down to the Data Buffering section.
Choose whether NFS will be used or not, and choose the Data Buffering Facility level here.

![Data Buffering](image)

Figure 24: Data Buffering section of the General page

Step 9: Click the Submit button.

Step 10: Make the changes effective.
Click on the Administration > Run Configuration link, check the Serial Ports/Ethernet/Static Routes box and click on the Activate Configuration button.

Step 11: Click on the link Administration > Load/Save Configuration.

Step 12: Click the Save Configuration to Flash button.

Wizard Method

Step 1: Bring up the wizard.
At the command prompt, type the following to bring up the Data Buffer custom wizard:

```
wiz --db
```
**Screen 1:**

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system
   and press ENTER. Enter '#' if you want to
deactivate that parameter or
2) Press ENTER if you are satisfied with the value
   within the brackets [ ] and want to go on to the
   next parameter or
3) Press ESC if you want to exit.

NOTE: For some parameters, if there is nothing within
the brackets, it will continue to ask for a value.
In that case, you must enter a valid value or # if you
do not wish to configure the value.

Press ENTER to continue...

**Screen 2:**

***********************************************************

******** *CONFIGURATION WIZARD ********
***********************************************************

CONF.NFS_DATA_BUFFERING - This parameter applies only if users choose to remotely buffer data. This is the remote directory name where data buffering will be written to instead of the default directory '/var/run'. If deactivated, data buffering will be done locally.

conf.nfs_data_buffering[#] :

ALL.DATA_BUFFERING - For local data buffering, this parameter represents the maximum file size in bytes allowed to be captured before it is discarded for new space. If remote this parameter is just a flag to either activate (any value greater than 0) or deactivate data buffering.

all.data_buffering[0] :

Screen 4:

***********************************************************
******** *CONFIGURATION WIZARD ********
***********************************************************

ALL.DB_MODE - For local data buffering, this parameter allows users to buffer data in either a circular or linear fashion. Circular format (cir) is a revolving buffer file that is overwritten whenever the limit of the buffer size (set by all.data_buffering) is reached. In linear format (lin), data transmission between the remote device and the serial port ceases once the 4k bytes Rx buffer in the kernel is reached. Then if a session is established to the serial port, the data in the buffer is shown (dont_show_DBmenu must be 2), cleared, and data transmission is resumed. Linear buffering is impossible if flow control is set to none. Default is cir.

all.DB_mode[cir] :
Chapter 3 - Additional Features

ALL.DONT_SHOW_DBMENU - When 0, a menu with data buffering options is shown when a non-empty data buffering file is found. When 1, the data buffering menu is not shown. When 2, the data buffering menu is not shown but the data buffering file is shown if not empty. When 3, the data buffering menu is shown, but without the 'erase and show' and 'erase' options.

all.dont_show_DBmenu[0] :

Screen 5:

***********************************************************
********* CONFIGURATION WIZARD ***********
***********************************************************

ALL.DB_TIMESTAMP - Records the time stamp in the data buffering file (1) or not (0). In case it is configured as 1, the software will accumulate input characters until it receives a CR and LF from the serial port, or the accumulated data reaches 256 characters. Either way, the accumulated data will be recorded in the data buffering file along with the current time. The parameter, all.data_buffering, has to be nonzero in order for this parameter to work.

all.DB_timestamp[0] :

ALL.SYSLOG_BUFFERING - This parameter is another option to data buffering. Users can also have syslog perform this function along with data buffering into files. When nonzero, the contents of the data buffer are sent to the syslog-ng every time a quantity of data equal to this parameter is collected. The syslog level for data buffering is hard coded to level 5 (notice) and facility conf.DB_facility. The file /etc/syslog-ng/syslog-ng.conf should be set accordingly for the syslog-ng to take some action.

(Please see the 'Syslog-ng Configuration to use with
Chapter 3 - Additional Features

Syslog Buffering Feature' section under Generating Alarms in Chapter 3 of the system's manual for the syslog-ng configuration file.)

all.syslog_buffering[0] :

***********************************************************
********* CONFIGURATION WIZARD *********
***********************************************************

ALL.SYSLOG_SESS - In order for this parameter to function, make sure syslog buffering is activate. When set as 0, syslog messages are always generated whether or not there is a connection to the port that is sending data to your unit. When set to 1, syslog messages are NOT generated when there IS a connection to the port that is sending data. It is only generated when there isn't a session to the port that is sending data to your unit.

all.syslog_sess[0] :

all.DB_mode : cir
all.dont_show_DBmenu : 0
all.DB_timestamp : 0
all.syslog_buffering : 0
all.syslog_sess : 0

Are these configuration(s) all correct? (y/n) [n] : 
Chapter 3 - Additional Features

If you type 'n'
Type 'c' to go back and CORRECT these parameters or 'q' to QUIT :
Typing 'c' repeats the application, typing 'q' exits the entire wiz application
If you type 'y'
Discard previous port-specific parameters? (y/n) [n] :

Note: Answering yes to this question will discard only the parameter(s) which you are currently configuring if they were configured for a specific port in a previous session. For instance, if you are currently configuring parameter, all.x, and there was a specific port, s2.x, configured; then, answering yes to this question will discard s2.x.

Type 'c' to CONTINUE to set these parameters for specific ports or 'q' to QUIT :
Typing 'c' leads to Screen 8, typing 'q' leads to Screen 9.
Screen 8:
***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************
You have 8 available ports on this system.
Type 'q' to quit, a valid port number[1-8], or anything else to refresh :
Chapter 3 - Additional Features

Note: The number of available ports depends on the system you are on. Typing in a valid port number repeats this program except this time it's configuring for the port number you have chosen. Typing 'q' leads to Screen 9.

Screen 9:
***********************************************************
******** *CONFIGURATION WIZARD ********
***********************************************************
(Note: If you are NOT connected to this unit through a console, and you have just reconfigured the IP of this unit, activating the new configurations may cause you to lose connection. In that case, please reconnect to the unit by the new IP address, and manually issue a saveconf to save your configurations to flash.)

Do you want to activate your configurations now? (y/n) [y] :

Screen 10:
***********************************************************
******** *CONFIGURATION WIZARD ********
***********************************************************

Flash refers to a type of memory that can be erased and reprogrammed in units of memory known as blocks rather than one byte at a time; thus, making updating to memory easier.

If you choose to save to flash, your configurations thus far will still be in the memory of the system even after you reboot it. If you don't save to flash and if you were to reboot the system, all your new configurations will be lost.
Chapter 3 - Additional Features

and you will have to reconfigure the system.

Do you want to save your configurations to flash? (y/n) [n] :

CLI Method
To configure certain parameters for a specific serial port.

**Step 1:** At the command prompt, type in the appropriate command to configure desired parameters.
To activate the serial port. `<string>` should be `ttyS<serial port number>`:
```
config configure line <serial port number> tty <string>
```

To configure `nfs_data_buffering`:
```
config configure conf nfsdb <string>
```

To configure `data_buffering`:
```
config configure line <serial port number> databuffering <number>
```

To configure `DB_mode`:
```
config configure line <serial port number> dbmode <string>
```

To configure `dont_show_DBmenu`:
```
config configure line <serial port number> dbmenu <number>
```

To configure `DB_timestamp`:
```
config configure line <serial port number> dbtimestamp <number>
```

To configure `syslog_buffering`:
```
config configure line <serial port number> syslogdb <number>
```
Chapter 3 - Additional Features

Tip. You can configure all the parameters for a serial port in one line:

```
config configure line <serial port number> tty <string>
conf nfsdb <string> db <number> dbmode <string> dbmenu <number> dbtimestamp <number> syslogdb <number>
```

Step 2: Activate and Save.

To activate your new configurations and save them to flash, type:

```
config write
```

(This is essentially typing `signal_ras hup` and `saveconf` from the normal terminal prompt.)
The DHCP (Dynamic Host Configuration Protocol) Client is available for firmware versions 1.2.x and above. DHCP is a protocol that allows network administrators to assign IP addresses automatically to network devices. Without DHCP (or a similar protocol like BOOTP), each device would have to be manually configured. DHCP automatically sends a new IP address to a connected device when it is moved to another location on the network. DHCP uses the concept of a fixed time period during which the assigned IP address is valid for the device it was assigned for. This "lease" time can vary for each device. A short lease time can be used when there are more devices than available IP numbers. For more information, see RFC 2131.

Parameter Involved and Passed Values

The DHCP client on the Ethernet Interface can be configured in two different ways, depending on the action the AlterPath Console Server should take in case the DHCP Server does not answer the IP address request:

1. No action is taken and no IP address is assigned to the Ethernet Interface (most common configuration):
   - Set the global parameter conf.dhcp_client to 1.
   - Comment all other parameters related to the Ethernet Interface (conf.eth_ip, etc.).
   - Add the necessary options to the file /etc/network/dhcpcd_cmd (some options are described below).

2. The AlterPath Console Server restores the last IP address previously provided in another boot and assigns this IP address to the Ethernet Interface. For the very first time the unit is powered ON, the IP address restored is 192.168.160.10 in case of failure in the DHCP. The unit goes out from the factory with DHCP enabled (conf.dhcp_client 2):
   - Set the global parameter conf.dhcp_client to 2.
   - Comment all other parameters related to the Ethernet Interface (conf.eth_ip, etc.).
   - Add the following lines to the file /etc/config_files:

     /etc/network/dhcpcd_cmd
     (from factory file already present in /etc/config_files)
Chapter 3 - Additional Features

/etc/dhcpcd-eth0.save
(from factory file already present in /etc/config_files)

• Add the option “-x” to the factory default content of the file
   /etc/network/dhcpcd_cmd:

   /bin/dhcpcd -x -c /bin/handle_dhcp

   From the factory, /etc/network/dhcpcd_cmd has already has such content.

• Add all other necessary options to the file /etc/network/dhcpcd_cmd (some
   options are described below). In both cases if the IP address of the AlterPath Con-
   sole Server or the default gateway are changed, the AlterPath Console Server will
   adjust the routing table accordingly.

Two files are related to DHCP:

/bin/handle_dhcp   The script which is run by the DHCP client each time an IP
         address negotiation takes place.

/etc/network/dhcpcd_cmd   Contains a command that activates the DHCP client (used
         by the cy_ras program). Its factory contents are:

         /bin/dhcpcd -c /bin/handle_dhcp

The options available that can be used on this command line are:

-D This option forces dhcpcd to set the domain name of the host to the domain name
   parameter sent by the DHCP Server. The default option is to NOT set the domain
   name of the host to the domain name parameter sent by the DHCP Server.

-H This option forces dhcpcd to set the host name of the host to the hostname
   parameter sent by the DHCP Server. The default option is to NOT set the host name
   of the host to the hostname parameter sent by the DHCP Server.

-R This option prevents dhcpcd from replacing the existing /etc/resolv.conf file.
Chapter 3 - Additional Features

**Configuration for CAS, TS, and Dial-in Access**

**vi Method**
Steps 1 and 2 under Parameters and Passed Values should be followed. You’ll need to edit `/etc/portslave/pslave.conf`, comment some lines, etc.

**Browser Method**
To configure DHCP via your Web browser:

**Step 1:** Point your browser to the ACS.
In the address or location field of your browser type:

<Console Access Server’s IP address>

**Step 2:** Log in as root and type the Web root password configured by the Web server.
This will take you to the Configuration and Administration page.

**Step 3:** Click the General link on the Link Panel.
This takes you to the General page.

**Step 4:** Scroll down to the Ethernet port section.
You can choose the DHCP Client option in this section. Select the radio button and click the Submit button at the bottom of the page.

**Note.** Do not modify the `-c /bin/handle_dhcp` option.
Chapter 3 - Additional Features

Figure 25: DHCP client section

<table>
<thead>
<tr>
<th>Ethernet port</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary IP Address:</td>
</tr>
<tr>
<td>Network Mask:</td>

Step 5: Make the changes effective.
Click on the Administration > Run Configuration link, check the Serial Ports/Ethernet/Static Routes box and click on the Activate Configuration button.

Step 6: Click on the link Administration > Load/Save Configuration.

Step 7: Click the Save Configuration to Flash button.
The configuration will be saved in flash.
Chapter 3 - Additional Features

Dual Power Management

The AlterPath ACS comes with two power supplies which it can self-monitor. If either of them fails, two actions are performed: sounding a buzzer and generating a syslog message. This automanagement can be disabled (no actions are taken) or enabled (default), any time by issuing the commands:

```
signal_ras buzzer off
signal_ras buzzer on
```

To disable the buzzer in boot time, edit the shell script `/bin/ex_wdt_led.sh` and remove the keyword “buzzer.” The buzzer won’t sound if there is a power failure in any power supply. This parameter does not affect the behavior of the command “signal_ras buzzer on/off.” To make this change effective even after future reboots, create a line with “/bin/ex_wdtLed.sh” in `/etc/config_files`, save and quit that file and run saveconf.

Note: This section applies only to the dual power supply model of the AlterPath ACS.

Parameters Involved and Passed Values

There are no parameters to be configured. However, if you want to generate alarms in case of a power failure, the syslog-ng.conf file must be changed. See the section Generating Alarms.

Configuration for CAS

vi Method

Files to be changed:

```
/etc/syslog-ng/syslog-ng.conf
```

Browser Method

Follow the steps described in the section “Generating Alarms.”
Chapter 3 - Additional Features

Configuration for TS

vi Method
Same as for CAS.

Configuration for Dial-in Access

vi Method
Same as for CAS.

Filters and Network Address Translation

The Filter feature is available for firmware version 2.1.0 and above; the Network Address Translation (NAT) feature is available for firmware version 2.1.1 and above.

Description

IP filtering consists of blocking or not the passage of IP packets, based on rules which describe the characteristics of the packet, such as the contents of the IP header, the input/output interface, or the protocol. This feature is used mainly in firewall applications, which filter the packets which could crack the network system or generate unnecessary traffic in the network.

Network Address Translation (NAT) allows the IP packets to be translated from local network to global network, and vice-versa. This feature is particularly useful when there is demand for more IP addresses in the local network than available as global IP addresses. In the AlterPath Console Server, this feature will be used mainly for clustering (one “master” Console server works as the interface between the global network and the “slave” Console servers).

The AlterPath Console Server uses the Linux utility iptables to set up, maintain and inspect both the filter and the NAT tables of IP packet rules in the Linux kernel. Besides filtering or translating packets, the iptables utility is able to count the packets which match a rule, and to create logs for specific rules.
Chapter 3 - Additional Features

Structure of the iptables

The iptables are structured in three levels: table, chain, and rule. A table can contain several chains, and each chain can contain several rules.

Table

The table indicates how the iptables will work. There are currently three independent tables supported by the iptables, but only two will be used:

- **filter**: This is the default table.
- **nat**: This table is consulted when a packet that creates a new connection is encountered.

Chain

Each table contains a number of built-in chains and may also contain user-defined chains. The built-in chains will be called according to the type of packet. User-defined chains will be called when a rule which is matched by the packet points to the chain. Each table has a particular set of built-in chains:

for the filter table:

- **INPUT**: For packets coming into the box itself.
- **FORWARD**: For packets being routed through the box.
- **OUTPUT**: For locally-generated packets.
Chapter 3 - Additional Features

for the nat table:

PREROUTING For altering packets as soon as they come in.
OUTPUT For altering locally-generated packets as soon as they come in.
POSTROUTING For altering packets as they are about to go out.

Rule
Each chain has a sequence of rules. These rules contain:

How the packet should appear in order to match the rule. Some information about the packet is checked according to the rule, for example, the IP header, the input and output interfaces, the TCP flags and the protocol.

What to do when the packet matches the rule. The packet can be accepted, blocked, logged or jumped to a user-defined chain. For the nat table, the packet can also have its source IP address and source port altered (for the POSTROUTING chain) or have the destination IP address and destination port altered (for the PREROUTING and OUTPUT chain).

When a chain is analyzed, the rules of this chain are reviewed one-by-one until the packet matches one rule. If no rule is found, the default action for that chain will be taken.

Syntax
An iptables tutorial is beyond the scope of this manual. For more information on iptables, see the iptables man page (not included with the AlterPath Console Server) or the how-to:
http://www.netfilter.org or http://www.iptables.org

The syntax of the iptables command is:

iptables -command chain rule-specification [ -t table ] [ options ]
iptables -E old-chain-name new-chain-name
Chapter 3 - Additional Features

where:

**table** Can be filter or nat. If the option -t is not specified, the filter table will be assumed.

**chain** Is one of the following:

- for filter table: INPUT, OUTPUT, FORWARD or a user-created chain.
- for nat table: PREROUTING, OUTPUT, POSTROUTING or a user-created chain.

Command

Only one command can be specified on the command line unless otherwise specified below. For all the long versions of the command and option names, you need to use only enough letters to ensure that iptables can differentiate it from all other options.

- **-A** Append one or more rules to the end of the selected chain. When the source and/or destination names resolve to more than one address, a rule will be added for each possible address combination.
- **--append**

- **-D** Delete one or more rules from the selected chain. There are two versions of this command. The rule can be specified as a number in the chain (starting at 1 for the first rule) or as a rule to match.
- **--delete**

- **-R** Replace a rule in the selected chain. If the source and/or destination names resolve to multiple addresses, the command will fail. Rules are numbered starting at 1.
- **--replace**

- **-I** Insert one or more rules in the selected chain as the given rule number. Thus if the rule number is 1, the rule or rules are inserted at the head of the chain. This is also the default if no rule number is specified.
- **--insert**

- **-L** List all rules in the selected chain. If no chain is selected, all chains are listed. It is legal to specify the -Z (zero) option as well, in which case the chain(s) will be atomically listed and zeroed. The exact output is affected by the other arguments given.
- **--list**

- **-F** Flush the selected chain. This is equivalent to deleting all the rules one-by-one.
- **--flush**
Chapter 3 - Additional Features

- `Z` or `--zero` Zero the packet and byte counters in all chains. It is legal to specify the `-L`, `--list (list)` option as well, to see the counters immediately before they are cleared. (See above.)

- `N` or `--new-chain` New chain. Create a new user-defined chain by the given name. There must be no target of that name already.

- `X` or `--delete-chain` Delete the specified user-defined chain. There must be no references to the chain. If there are, you must delete or replace the referring rules before the chain can be deleted. If no argument is given, it will attempt to delete every non-built-in chain in the table.

- `P` or `--policy` Set the policy for the chain to the given target. Only non-user-defined chains can have policies, and neither built-in nor user-defined chains can be policy targets.

- `E` or `--rename-chain` Rename the user-specified chain to the user-supplied name. This is cosmetic, and has no effect on the structure of the table.

- `h` or `--help` Help. Gives a (currently very brief) description of the command syntax.

Rule Specification

- `p` or `--protocol(!)protocol` The protocol of the rule or of the packet to check. The specified protocol can be one of tcp, udp, icmp, or all, or it can be a numeric value, representing one of these protocols or a different one. A protocol name from /etc/protocols is also allowed. A "!" argument before the protocol inverts the test. The number zero is equivalent to all. Protocol all will match with all protocols and is taken as default when this option is omitted.

- `s` or `--source(!)address[/mask]` Source specification. Address can be either a hostname, a network name, or a plain IP address. The mask can be either a network mask or a plain number, specifying the number of 1's at the left side of the network mask. Thus, a mask of 24 is equivalent to 255.255.255.0. A "!" argument before the address specification inverts the sense of the address. The flag `--src` is a convenient alias for this option.
Chapter 3 - Additional Features

Options
The following additional options can be specified:

-d  -destination![!]address[/mask]
    Destination specification. See the description of the -s (source) flag for a detailed description of the syntax. The flag -dst is an alias for this option.

-j  --jump target
    This specifies the target of the rule; i.e., what to do if the packet matches it. The target can be a user-defined chain (other than the one this rule is in), one of the special built-in targets which decide the fate of the packet immediately, or an extension (see EXTENSIONS below). If this option is omitted in a rule, then matching the rule will have no effect on the packet's fate, but the counters on the rule will be incremented. The special built-in targets are:
    • ACCEPT means to let the packet through.
    • DROP means to drop the packet on the floor.
    • QUEUE means to pass the packet to userspace (if supported by the kernel).
    • RETURN means stop traversing this chain and resume at the next rule in the previous (calling) chain. If the end of a built-in chain is reached or a rule in a built-in chain with target RETURN is matched, the target specified by the chain policy determines the fate of the packet.

-i  -in-interface[!]name
    Optional name of an interface via which a packet is received (for packets entering the INPUT and FORWARD chains). When the "!" argument is used before the interface name, the sense is inverted. If the interface name ends in a "+" then any interface which begins with this name will match. If this option is omitted, the string "+" is assumed, which will match with any interface name.
Chapter 3 - Additional Features

-o -out-interface[!]name
Optional name of an interface via which a packet is going to be sent (for packets entering the FORWARD and OUTPUT chains). When the "!” argument is used before the interface name, the sense is inverted. If the interface name ends in a "+" then any interface which begins with this name will match. If this option is omitted, the string "+" is assumed, which will match with any interface name.

[!] -f -fragment
This means that the rule only refers to second and further fragments of fragmented packets. Since there is no way to tell the source or destination ports of such a packet (or ICMP type), such a packet will not match any rules which specify them. When the "!” argument precedes the "-f" flag, the rule will only match head fragments, or unfragmented packets.

-c -set-counters PKTS BYTES
This enables the administrator to initialize the packet and byte counters of a rule (during INSERT, APPEND, REPLACE operations).

-v -verbose
Verbose output. This option makes the list command show the interface address, the rule options (if any), and the TOS masks. The packet and byte counters are also listed, with the suffix ‘K’, ‘M’ or ‘G’ for 1000, 1,000,000 and 1,000,000,000 multipliers respectively (but see the -x flag to change this). For appending, insertion, deletion and replacement, this causes detailed information on the rule or rules to be printed.

-n -numeric
Numeric output. IP addresses and port numbers will be printed in numeric format. By default, the program will try to display them as host names, network names, or services (whenever applicable).

-x -exact
Expand numbers. Display the exact value of the packet and byte counters, instead of only the rounded number in K’s (multiples of 1000) M’s (multiples of 1000K) or G’s (multiples of 1000M). This option is only relevant for the -L command.

-line-numbers
When listing rules, add line numbers to the beginning of each rule, corresponding to that rule’s position in the chain.
Chapter 3 - Additional Features

Match Extensions
Iptables can use extended packet matching modules. These are loaded in two ways:
implicitly, when -p or -protocol is specified, or with the -m or -match option, followed by
the matching module name; after these, various extra command line options become
available, depending on the specific module.

TCP Extension
These extensions are loaded if the protocol specified is tcp or "-m tcp" is specified. It
provides the following options:

```
-source-port [!] [port[:port]]
```
Source port or port range specification. This can
either be a service name or a port number. Inclusive
range can also be specified, using the format
port:port. If the first port is omitted, "0" is assumed; if
the last is omitted, "65535" is assumed. If the second
port is greater then the first they will be swapped. The
flag -sport is an alias for this option.

```
-destination-port [!] [port[:port]]
```
Destination port or port range specification. The flag
-dport is an alias for this option.

```
tcp-flags [!] mask comp
```
Match when the TCP flags are as specified. The first
argument is the flags which we should examine, writ-
ten as a comma-separated list, and the second argu-
ment is a comma-separated list of flags which must be
set. Flags are: SYN ACK FIN RST URG PSH ALL NONE.
Hence the command iptables
-A FORWARD -p tcp -tcp-flags SYN,ACK,FIN,RST SYN
will only match packets with the SYN flag set, and the
ACK, FIN and RST flags unset.

```
[!] -syn
```
Only match TCP packets with the SYN bit set and the
ACK and FIN bits cleared. Such packets are used to
request TCP connection initiation; for example, block-
ing such packets coming in an interface will prevent
incoming TCP connections, but outgoing TCP con-
nections will be unaffected. It is equivalent to
-tcp-flags SYN,RST,ACK SYN.
If the "!" flag precedes the "-syn," the sense of the
option is inverted.
Chapter 3 - Additional Features

UDP Extension
These extensions are loaded if the protocol udp is specified or “-m udp” is specified. It provides the following options:

- -source-port [!] [port[:port]] Source port or port range specification. See the description of the -source-port option of the TCP extension for details.

- -destination-port [!] [port[:port]] Destination port or port range specification. See the description of the -destination-port option of the TCP extension for details.

ICMP Extension
This extension is loaded if the protocol icmp is specified or “-m icmp” is specified. It provides the following option:

- -icmp-type [!] typename This allows specification of the ICMP type, which can be a numeric ICMP type, or one of the ICMP type names shown by the command iptables -p icmp -h

Multiport Extension
This module matches a set of source or destination ports. Up to 15 ports can be specified. It can only be used in conjunction with -m tcp or -m udp.

- -source-port [port[,port]] Match if the source port is one of the given ports.
- -destination-port [port[,port]] Match if the destination port is one of the given ports.
- -port [port[,port]] Match if the both the source and destination port are equal to each other and to one of the given ports.
Chapter 3 - Additional Features

Target Extensions
Iptables can use extended target modules. The following are included in the standard distribution.

LOG
Turn on kernel logging of matching packets. When this option is set for a rule, the Linux kernel will print some information on all matching packets (like most IP header fields) via the kernel log (where it can be read with syslog-ng).

- \(-log\text{-level level}\) Level of logging (numeric or see syslog.conf(5)).
- \(-log\text{-prefix prefix}\) Prefix log messages with the specified prefix; up to 29 letters long, and useful for distinguishing messages in the logs.
- \(-log\text{-tcp\text{-sequence}}\) Log TCP sequence numbers. This is a security risk if the log is readable by users.
- \(-log\text{-tcp\text{-options}}\) Log options from the TCP packet header.
- \(-log\text{-ip\text{-options}}\) Log options from the IP packet header.

REJECT (filter table only)
This is used to send back an error packet in response to the matched packet: otherwise it is equivalent to DROP. This target is only valid in the INPUT, FORWARD and OUTPUT chains, and user-defined chains which are only called from those chains. Several options control the nature of the error packet returned:

- \(-reject\text{-with type}\) The type given can be icmp-net-unreachable, icmp-host-unreachable, icmp-port-unreachable, icmp-proto-unreachable, icmp-net-prohibited or icmp-host-prohibited, which return the appropriate ICMP error message (port-unreachable is the default). The option echo-reply is also allowed; it can only be used for rules which specify an ICMP ping packet, and generates a ping reply. Finally, the option tcp-reset can be used on rules which only match the TCP protocol: this causes a TCP RST packet to be sent back. This is mainly useful for blocking ident probes which frequently occur when sending mail to broken mail hosts (which won't accept your mail otherwise).
Chapter 3 - Additional Features

SNAT (nat table only)
This target is only valid in the nat table, in the POSTROUTING chain. It specifies that the source address of the packet should be modified (and all future packets in this connection will also be mangled), and rules should cease being examined. It takes one option:

- `--to-source <ipaddr>[<ipaddr>][:port-port]` This can specify a single new source IP address, an inclusive range of IP addresses, and optionally, a port range (which is only valid if the rule also specifies `-p tcp` or `-p udp`). If no port range is specified, then source ports below 512 will be mapped to other ports below 512: those between 512 and 1023 inclusive will be mapped to ports below 1024, and other ports will be mapped to 1024 or above. Where possible, no port alteration will occur.

DNAT (nat table only)
This target is only valid in the nat table, in the PREROUTING and OUTPUT chains, and user-defined chains which are only called from those chains. It specifies that the destination address of the packet should be modified (and all future packets in this connection will also be mangled), and rules should cease being examined. It takes one option:

- `--to-destination <ipaddr>[<ipaddr>][:port-port]` This can specify a single new destination IP address, an inclusive range of IP addresses, and optionally, a port range (which is only valid if the rule also specifies `-p tcp` or `-p udp`). If no port range is specified, then the destination port will never be modified.

MASQUERADE (nat table only)
This target is only valid in the nat table, in the POSTROUTING chain. It should only be used with dynamically assigned IP (dialup) connections: if you have a static IP address, you should use the SNAT target. Masquerading is equivalent to specifying a mapping to the IP address of the interface the packet is going out on, but also has the effect that connections are forgotten when the interface goes down. This is the correct behavior when the next dialup is unlikely
Chapter 3 - Additional Features

to have the same interface address (and hence any established connections are lost anyway). It takes one option:

- -to-ports <port>[-<port>] This specifies a range of source ports to use, overriding the default SNAT source port-selection heuristics (see above). This is only valid with if the rule also specifies -p tcp or -p udp).

REDIRECT (nat table only)
This target is only valid in the nat table, in the PREROUTING and OUTPUT chains, and user-defined chains which are only called from those chains. It alters the destination IP address to send the packet to the machine itself (locally-generated packets are mapped to the 127.0.0.1 address). It takes one option:

- -to-ports <port>[-<port>] This specifies a destination port or range or ports to use: without this, the destination port is never altered. This is only valid with if the rule also specifies -p tcp or -p udp).

Parameters Involved and Passed Values

The file with the iptables rules is /etc/network/firewall. The fwset script saves the iptables rules in the file /etc/network/firewall (command iptables-save > /etc/network/firewall) and then save the file in the flash memory. The fwset restore restores the iptables rules previously saved in /etc/network/firewall file (command iptables-restore </etc/network/firewall). This command is executed at boot to invoke the last configuration saved.

Configuration for CAS, TS, and Dial-in Access

vi method

Step 1: Execute fwset restore.

This script will restore the IP Tables chains and rules configured in the /etc/network/firewall all file. This script can be called in the process, whenever the user wants to restore the original configuration.

Step 2: Add the chains and rules using the command line.

See details of the iptables syntax earlier in this chapter.
Chapter 3 - Additional Features

Step 3: Execute `iptables-save > /etc/network/firewall`.
This program will save all the rules and chains of all the tables in the `/etc/network/firewall` file.

Step 4: Execute `updatefiles /etc/network/firewall`.
This program will save the configuration to the flash memory.

Browser method

Step 1: Point the browser to the Console Server.
In the Address or Location field of your browser type the IP Address or the alias of your console server.

Step 2: Log in.
Log in as root, and type the password configured for the root user. This will take you to the Configuration and Administration page.

Step 3: Select the IPTables link.
On the Configuration section of this page, select the IPTables link. The following page will appear.

![First IP Tables page]

The options in this page are:

- **List Chains**
  List all the chains of the table selected.

- **Save in File**
  Save the all the IP tables rules, chains and tables to the file `/etc/network/firewall`.

- **Restore from File**
  Reads the file `/etc/network/firewall` and make the IP Tables configuration from that file effective.
Chapter 3 - Additional Features

Step 4: **Select the filter table. Click the List Table button.**
A table with all the chains of the table, and the number of bytes/packets which used each chain will appear. The available options are:

- **List Rules**: This option shows all the rules related to the chain selected.
- **Edit Chain**: Will be valid only for built-in chains. The user will be able to edit the default policy.
- **Delete Chain**: Only user-defined chains can be deleted.
- **Insert Chain**: If the chain name is entered, this option will cause the program to try to create a chain with this name.

![IP Tables Chains Table](table_filter)

**Figure 27: IP Tables Chains Table (table filter)**

Step 5: **Edit the chain list**
If the user needs to define new chains, write in the Chain Name text input and click the Insert Chain button. If the default policy for a chain needs to be changed, select the chain and click the Edit Chain button. Select the new policy and click Submit.

Step 6: **Choose one of the chains and click the List Rules button.**
A table with all the rules related to the chain selected will appear in the page, containing the rule configuration and the accounting (number of bytes and packets which used the rule). In the beginning, there are no rules in the chain: in this case, the only option is to Append Rule.
Chapter 3 - Additional Features

When there are rules in the chain, the page will appear like the picture below. The options are:

- **Replace Rule**: Replace the rule selected with another rule, defined by the user.
- **Insert Rule**: Insert a new rule in the position selected. After the rule is defined, all the rules from that position will move down.
- **Append Rule**: Insert a rule in the bottom of the list.
- **Delete Rule**: Remove the rule selected from the list.

![IP Tables Rules Table](image)

**Figure 28: IP Tables Rules Table (table: filter, chain: INPUT)**

**Step 7:** Click the button Append Rule to start.

The page which follows is for configuring the rule. There are several parameters related to a rule:

**Note:** For many parameters, there is a checkbox called inverted. Checking this box will invert the sense of the parameter.
Chapter 3 - Additional Features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target</td>
<td>Indicates the action to be performed when the IP packet matches the rule. The kernel can ACCEPT the packet, DROP it, LOG it, REJECT it by sending a message, translating the source or the destination IP address/port (in the nat table) or send the packet to another user-defined chain. All the options are in the target list.</td>
</tr>
<tr>
<td>Source/Destination IP</td>
<td>Indicates how the source/destination IP address should be. When a network should be included in the rule, the network mask must be configured too.</td>
</tr>
<tr>
<td>Input/Output interface</td>
<td>Indicates the interface where the IP packet should pass. The Input Interface option will appear only for the chains INPUT, FORWARD and PREROUTING; the Output interface option will appear for the chains FORWARD, OUTPUT and POSTROUTING.</td>
</tr>
<tr>
<td>Protocol</td>
<td>Indicates the transport protocol to check. If the numeric value is available, select numeric and type the value in the text input; otherwise, select one of the other options.</td>
</tr>
<tr>
<td>Fragments</td>
<td>Indicates if the fragments will be checked. The IP Tables can either check for head fragments and unfragmented packets or for the subsequent fragments.</td>
</tr>
<tr>
<td>TCP options</td>
<td>This section will appear only when TCP protocol is selected. The source/destination ports can be configured in this section, as well as the TCP flags.</td>
</tr>
<tr>
<td>UDP options</td>
<td>This section will appear only when UDP protocol is selected. The source/destination ports can be configured in this section.</td>
</tr>
<tr>
<td>ICMP options</td>
<td>This section will appear only when ICMP protocol is selected. The ICMP type can be configured in this section.</td>
</tr>
<tr>
<td>LOG options</td>
<td>This section will appear only when the target selected is LOG. It contains parameters to set the way the logs will appear (syslog level, prefix, flags).</td>
</tr>
<tr>
<td>REJECT options</td>
<td>This section will appear only when the target selected is REJECT. It indicates what message the filter will send when the IP packet is rejected.</td>
</tr>
</tbody>
</table>
Chapter 3 - Additional Features

Figure 29: IP Tables Append Rule (table: filter, chain: INPUT)

<table>
<thead>
<tr>
<th>General</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target:</td>
</tr>
<tr>
<td>Source IP:</td>
</tr>
<tr>
<td>Destination IP:</td>
</tr>
<tr>
<td>Protocol:</td>
</tr>
<tr>
<td>Input Interface:</td>
</tr>
<tr>
<td>Fragments:</td>
</tr>
</tbody>
</table>

Submit

Step 8: Configure the rule and click the Submit button.
If there is an error in the configuration, a red message will appear with the page; otherwise, the rule will be included in the chain rules list.

Step 9: Repeat steps 7 and 8 to add as many rules as necessary.

Step 10: Click on the link [IP Tables Chains Table] if there are rules to be added in other chains.
Repeat steps 6 to 8 to add rules for other chains.

Step 11: Click on the link [IP Tables] if the nat table must be edited.
Select the nat table and click on the List Chains button. Repeat steps 5 to 8 to edit the chains and rules in the nat table. The tables presented on the Web page are the same as in the filter table, with the difference that there are more options in the Append/Insert/Replace Rule page:
Chapter 3 - Additional Features

**DNAT/SNAT options**

This section will appear only when the target selected is DNAT and SNAT, respectively. The parameters of these sections will determine how the packets matched by the rule will be translated. DNAT translates the destination IP Address/Port, and SNAT translates the source IP Address/Port.

**MASQUERADE/REDIRECT options**

This section will appear only when the target selected is MASQUERADE or REDIRECT. The parameter of these sections configure the port or the port range used to masquerade the source or to redirect the destination, respectively.

**Step 12:** Click on the link [IP Tables] and click on the Save to File button.
This will cause the rules and chains to be saved in the `/etc/network/firewall` file.

**Step 13:** Click on the link Administration > Load/Save Configuration and click the Save to Flash button.
This will save the rules and chains in the flash memory.
Chapter 3 - Additional Features

Generating Alarms

This feature helps the administrator to manage the servers. It filters the messages received by the serial port (the server’s console) based on the contents of the messages. It then performs an action, such as sending an email or pager message. To configure this feature, you need to configure filters and actions in the syslog-ng.conf file. (You can read more about syslog-ng in the Syslog section.)

Port Slave Parameters Involved with Generating Alarms

confDB_facility: This value (0-7) is the Local facility sent to the syslog-ng with data when syslog_buffering and/or alarm is active.

all.alarm: When nonzero, all data received from the port is captured and sent to syslog-ng with INFO level and LOCAL[0+conf.DB_facility] facility.

Configuration for CAS, TS, and Dial-in Access

vi Method
Files to be modified:

- pslave.conf
- syslog-ng.conf

Browser Method
To configure PortSlave parameters involved with syslog-ng and the syslog-ng configuration file with your browser:

Step 1: Point your browser to the ACS.
In the address or location field of your browser type:

<Console Access Server’s IP address>

Step 2: Log in as root and type the Web root password configured by the Web server.
This will take you to the Configuration and Administration page.
Chapter 3 - Additional Features

Step 3: Select the General link.

Click on the General link on the Link Panel to the left of the page in the Configuration section. This will take you to the General page.

Step 4: Scroll down to the Data Buffering section.

You can change the Data Buffering Facility value (conf.DB_facility). Click the Submit button.

Step 5: Select the Serial Ports link.

Click on the Serial Ports link on the Link Panel to the left of the page in the Configuration section. This will take you to the Port Selection page.

Step 6: Select port(s).

On the Port Selection page, choose all ports or an individual port to configure from the dropdown menu. Click the Submit button. This will take you to the Serial Port Configuration page.

Step 7: Scroll down to the Data Buffering section.

You can change the “Alarm for Data Buffering” (.alarm) value. Click the Submit button.

Step 8: Select the Syslog link.

Click on the Syslog link on the Link Panel to the left of the page in the Configuration section. This will take you to the Edit the Syslog-ng Configuration File page.

Step 9: Make the changes effective.

Click on the Administration > Run Configuration link, check the Serial Ports/Ethernet/Static Routes box and click on the Activate Configuration button.

Step 10: Click on the link Administration > Load/Save Configuration.

Step 11: Click the Save Configuration to Flash button.

The configuration was saved in flash.
Chapter 3 - Additional Features

Wizard Method

The Alarm Generation custom wizard configures the ALL.ALARM parameter.

Step 1: Bring up the wizard.

At the command prompt, type the following to bring up the Alarm Generation custom wizard:

```
wiz --al
```

Screen 1 (below) will appear.

Screen 1:

```
***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************
ALL.ALARM - When non zero, all data received from the port are captured and sent to syslog-ng with INFO level and LOCAL[0+conf.DB_facility] facility. The syslog-ng.conf file should be set accordingly, for the syslog-ng to take some action.

(Please see the 'Syslog-ng Configuration to use with Alarm Feature' section under Generating Alarms in Chapter 3 of the system's manual for the syslog-ng configuration file.)
```

all.alarm[0]:
Chapter 3 - Additional Features

Screen 2:

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

Current configuration:
(The ones with the '#' means it's not activated.)

all.alarm : 0

Set to defaults? (y/n) [n] :

Screen 3:

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

ALL.ALARM - When non zero, all data received from the port are captured and sent to syslog-ng with DAEMON facility and ALERT level. The syslog-ng.conf file should be set accordingly, for the syslog-ng to take some action.
(Please see the 'Syslog-ng Configuration to use with Alarm Feature' section under Generating Alarms in Chapter 3 of the system's manual for the syslog-ng configuration file.)

all.alarm[0] :

Note: conf.DB_facility is configured under the syslog parameters (wiz --sl).
Chapter 3 - Additional Features

Screen 4:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************
Current configuration:
(The ones with the '#' means it's not activated.)

all.alarm : 0

Are these configuration(s) all correct? (y/n) [n] :

If you type 'n'

Type 'c' to go back and CORRECT these parameters or 'q' to QUIT :

Typing 'c' repeats the application, typing 'q' exits the entire wiz application

If you type 'y'

Discard previous port-specific parameters? (y/n) [n] :

Note: Answering yes to this question will discard only the parameter(s) which you are currently configuring if they were configured for a specific port in a previous session. For instance, if you are currently configuring parameter, all.x, and there was a specific port, s2.x, configured; then, answering yes to this question will discard s2.x.

Type 'c' to CONTINUE to set these parameters for specific ports or 'q' to QUIT :

Typing 'c' leads to Screen 5, typing 'q' leads to Screen 6.
Chapter 3 - Additional Features

Screen 5:
***********************************************************
********* CONFIGURATION WIZARD *********
***********************************************************

You have 8 available ports on this system.

Type 'q' to quit, a valid port number[1-8], or anything else to refresh :

Note: The number of available ports depends on the system you are on. Typing in a valid port number repeats this program except this time it's configuring for the port number you have chosen. Typing 'q' leads to Screen 6.

Screen 6:
***********************************************************
********* CONFIGURATION WIZARD *********
***********************************************************

(Note: If you are NOT connected to this unit through a console, and you have just reconfigured the IP of this unit, activating the new configurations may cause you to lose connection. In that case, please reconnect to the unit by the new IP address, and manually issue a saveconf to save your configurations to flash.)

Do you want to activate your configurations now? (y/n) [y] :
Chapter 3 - Additional Features

Screen 7:
***********************************************************
********* CONFIGURATION WIZARD *********
***********************************************************

Flash refers to a type of memory that can be erased and reprogrammed in units of memory known as blocks rather than one byte at a time; thus, making updating to memory easier.

If you choose to save to flash, your configurations thus far will still be in the memory of the system even after you reboot it. If you don't save to flash and if you were to reboot the system, all your new configurations will be lost and you will have to reconfigure the system.

Do you want to save your configurations to flash? (y/n) [n]:

CLI Method
To configure certain parameters for a specific serial port:

Step 1: At the command prompt, type in the appropriate command to configure desired parameters.
To activate the serial port. <string> should be ttyS<serial port number>:

    config configure line <serial port number> tty <string>

To configure conf.DB_facility:

    config configure conf dbfacility <number>

To configure alarm:

    config configure line <serial port number> alarm <number>

Tip. You can configure all the parameters for a serial port in one line.

    config configure line <serial port number> tty <string>
    alarm <number>
Chapter 3 - Additional Features

Step 2: Activate and Save.
To activate your new configurations and save them to flash, type:

```
config write
```

(This is essentially typing `signal_ras hup` and `saveconf` from the normal terminal prompt.)

Syslog-ng Configuration to use with Alarm Feature
This configuration example is used for the alarm feature.

Step 1: Configure the pslave.conf file parameter.
In the pslave.conf file the parameters of the alarm feature are configured as:

```
all.alarm 1
cnf.DB_facility 2
```

Step 2: Add lines to syslog-ng.conf.
The syslog-ng.conf file needs these lines:

```
# local syslog clients
source sysl { unix-stream("/dev/log"); };

# To filter ALARM message with the string "kernel panic"
filter f_kpanic { facility(local2) and level(info) and match("ALARM") and match("kernel panic"); };

# To filter ALARM message with the string "root login"
filter f_root { facility(local2) and level(info) and match("ALARM") and match("root login"); };

# To send e-mail to z@none.com (SMTP's IP address 10.0.0.2)
# from the e-mail address a@none.com with subject "ALARM".
# The message will carry the current date, the hostname
```
Chapter 3 - Additional Features

# of this unit and the message that was received from the source.

destination d_mail1 {
  pipe("/dev/cyc_alarm"
    template("sendmail -t z@none.com -f a@none.com -s "ALARM" -m "FULLDATE $HOST $MSG" -h 10.0.0.2"));
};

# Example to send a pager to phone number 123 (Pager server at 10.0.0.1) with message
# carrying the current date, the hostname of this ACS and the message that was received from the source :

destination d_pager {
  pipe("/dev/cyc_alarm"
    template("sendsms -d 123 -m "FULLDATE $HOST $MSG" 10.0.0.1");
  );
};

# Example to send a Link Down trap to server at 10.0.0.1 with message carrying the current
# date, the hostname of this unit and the message that received from the source :

destination d_trap {
  pipe("/dev/cyc_alarm"
    template("snmptrap -v 1 -c public 10.0.0.1 "$FULLDATE $HOST $MSG" \.1.3.6.1.2.1.2.2.1.2.1 s "$FULLDATE $HOST $MSG" ");
  );
};

# To send e-mail and snmptrap if message received from local syslog client has the string "kernel panic":
Chapter 3 - Additional Features

log { source(sysl); filter(f_kpanic); destination(d_mail1); destination(d_trap); };

# To send e-mail and pager if message received from local syslog client has the string
# "root login":
log { source(sysl); filter(f_root); destination(d_mail1); destination(d_pager); };

Alarm, Sendmail, Sendsms and Smnptrap

Alarm
This feature is available only for the Console Server Application. The ACS sends messages using pager, e-mail, or smnptrap if the serial port receives messages with specific string. To configure this feature:

Step 1: Activate alarm in Portslove configuration file.
Parameter all.alarm - 0 inactive or <> 0 active.

Step 2: Configure filters in the syslog-ng configuration file.
filter f_alarm { facility(local[0+conf.DB_facility]) and level(info) and match("ALARM") and match("<your string>"); }

Example: to filter the ALARM message with the string "kernel panic" (conf.DB_facility is configured with value 1):
filter f_kpanic {facility(local1) and level(info) and match("ALARM") and match("kernel panic"); }; Example: to filter the ALARM message with the string "root login":
filter f_root { facility(local1) and level(info) and match("ALARM") and match("root login"); }

Step 3: Configure actions in the syslog-ng configuration file.
(See more details in syslog-ng examples.)

Example: alarm is active and if the serial port receives the string "kernel panic," one message will be sent to the pager.
Chapter 3 - Additional Features

log (source(sysl); filter(f_kpanic); destination(d_pager); }

To send e-mail:

destination d_mail { pipe("/dev/cyc_alarm" template("send-
mail <pars>")));

To send a pager message:

destination d_pager {pipe("/dev/cyc_alarm" template("sendsms
<pars>")));

To send snmptrap:

destination d_trap {pipe("/dev/cyc_alarm" template("snmptrap
<pars>")));

Step 4: Connect filters and actions in the syslog-ng configuration file.

Example: alarm is active and if the serial port receives the string “kernel panic,” one
message will be sent to the pager.

log (source(sysl); filter(f_kpanic); destination(d_trap);
destination(d_pager); }

Sendmail

Sendmail sends a message to a SMTP server. It is not intended as a user interface routine; it is
used only to send pre-formatted messages. Sendmail reads all parameters in the command
line. If the SMTP server does not answer the SMTP protocol requests sent by sendmail, the
message is dropped.

Synopsis:

sendmail -t <name>[,<name>] [-c <name> [,<name>]] [-b <name>
[,<name>]] [-r <name>] -f <name> -s <text> -m <text> -h <SMTP
server> [-p <smtp-port>]

where:
Chapter 3 - Additional Features

-t <name>[,<name>]  "To:" Required. Multi-part allowed (multiple names are separated by commas). Names are expanded as explained below.

-[c <name> [,<name>]]  "Cc:" Optional. Multi-part allowed (multiple names are separated by commas).

-[b <name> [,<name>]]  "Bcc:" Optional. Multi-part allowed (multiple names are separated by commas).

-[r <name>]  "Reply-To:" Optional. Use the Reply-To: field to make sure the destination user can send a reply to a regular mailbox.

-f <name>  "From:" Required.

-s <text>  "Subject:" Required.

-m <text>  "body" The message body.

-h <SMTP server>  Required. IP address or name of the SMTP server.

-[p <SMTP port>]  Optional. The port number used in the connection with the server. Default: 25.

<name>  Any email address.

<text>  A text field. As this kind of field can contain blank spaces, please use the quotation marks to enclose the text.

For example, to send e-mail to z@none.com (SMTP's IP address 10.0.0.2) from the e-mail address a@none.com with subject "sendmail test."

sendmail -t z@none.com -f a@none.com -s "sendmail test" -m "Sendmail test. \n Is it OK??? " -h 10.0.0.2

Sendsms
The sendsms is the Linux command line client for the SMSLink project. It accepts command line parameters that define the message to be sent, and transmits them to the SMS server process running on the designated server. The sendsms was developed specifically for easy calling from shell scripts or similar situations.
Chapter 3 - Additional Features

Synopsis:

```
sendsms [-r] [-g] [-v] -d dest (-m message or -f msgfile)
[-u user] [-p port] server
```

where:

- **-r**  
  Reporting. Additional info will be included in the message printed on stderr (namely, the device name used by the server to send the SMS out, and the message ID attributed to the SMS by the module's SIM card). If any of these items is missing or can't be parsed, a value of “??” will be returned.

- **-g**  
  Turns debugging on. Will output the entire dialog with the server on stderr (and more).

- **-h**  
  Displays a short help message and exits.

- **-v**  
  Displays version information and exits.

- **-d dest**  
  Required. The GSM network address (i.e. phone number) of the mobile phone the message is to be sent to. Supported format is: [int. prefix - country code] area code - phone number. The international prefix can be either “+” or “00” (or any other value supported by the GSM network provider the server is subscribed to). Some separation characters can be used to beautify the number, but they are purely cosmetic and will be stripped by the server. Those characters are [./- ]. The pause character (',') is not supported. Regarding the international country code, don't forget that its necessity is to be considered respective to the SMS gateway location (the host this client program is connecting to), not the location where the client is run from. In case of doubt, please contact the SMS server administrator for your network. Please always include the area code (even when sending to a destination in the same "area", i.e., on the same network). The number without the area code, though syntactically correct and accepted by the network, may never get delivered.
Chapter 3 - Additional Features

-m message  
Required (Use one and only one of "-m" or "-f"). The text of the message to be sent. Unless made up of a single word, it will have to be quoted for obvious reasons. Maximum length is 160 characters. A longer message will be truncated (you will be warned about it), but the message will still be sent. At the present time, only 7-bit ASCII is supported for the message text.

-f msgfile  
Required (use one and only one of "-m" or "-f"). The name of a text file where the message to send is to be read from. This file can contain multiple lines of text (they will be concatenated), but its total length can't exceed 160 characters. A longer text will be truncated (you will be warned about it), but the message will still be sent. The special file '-' means that input will be read from stdin. At the present time, only 7-bit ASCII is supported for the message text.

-u user  
Optional. The server module requires the user to identify her/himself for logging purposes. No authentication is performed on this information, however. If this parameter is omitted, sendsms will send the UNIX username of the current user. This parameter allows you to override this default behavior (might be useful in the case of automated sending).

-p port  
Optional. Communication port on the target server. If provided here, this value will be used to connect to the server. If omitted, the client will query the local system for the port number associated with the "well known service" sms (as defined in /etc/services). If that doesn't return an answer, the compiled-in default value 6701 will be used.

server  
Required. The host name or IP address of the computer where the SMS gateway server process is running. By default, this server will be listening on TCP port 6701.

Upon success (when the server module reports that the message was successfully sent), sendsms returns 0. When a problem occurs, a non zero value is returned. Different return values indicate different problems. A return value of 1 indicates a general failure of the client program.
Chapter 3 - Additional Features

COPYRIGHT: SMLink is (c) Les Ateliers du Heron, 1998 by Philippe Andersson.

Example to send a pager message to phone number 123 (Pager server at 10.0.0.1) with message:

```
sendsms -d 123 -m "Hi. This is a test message send from ACS using sendsms" 10.0.0.1
```

**Snmptrap**

Snmptrap is an SNMP application that uses the TRAP-PDU Request to send information to a network manager. One or more fully qualified object identifiers can be given as arguments on the command line. A type and a value must accompany each object identifier. Each variable name is given in the format specified. If any of the required version 1 parameters—enterprise-oid, agent and uptime—are specified as empty, it defaults to “1.3.6.1.4.1.3.1.1”, hostname, and host-uptime respectively.

**Synopsis**

```
snmptrap -v 1 [-Ci] [common arguments] enterprise-oid agent generic-trap specific-trap uptime [objectID type value]...
```

```
snmptrap -v [2|3] [-Ci] [common arguments] uptime trap-oid [objectID type value]...
```

where:

- `-Ci` Optional. It sends INFORM-PDU.
- `common arguments` Required. They are:
  
  "\`-c <community name> <SNMP server IP address>""
  
- `enterprise-oid` Required, but it can be empty ("").
- `agent` Required, but it can be empty (""). The agent name.
- `generic-trap` The generic trap number: 2 (link down), 3 (link up), 4 (authentication failure), ...
- `specific-trap` Required. The specific trap number.
- `uptime` Required.
Chapter 3 - Additional Features

If the network entity has an error processing the request packet, an error packet will be returned and a message will be shown, helping to pinpoint in what way the request was malformed. If there were other variables in the request, the request will be resent without the bad variable.

For example, to send a Link Down trap to server at 10.0.0.1 with interfaces.iftable.iftentry.ifde-scr:

```
snmptrap -v 1 -c public 10.0.0.1 "" 2 0 "" .1.3.6.1.2.1.2.2.1.2.1
s "ACS: serial port number 1 is down"
```

-Ci  Optional. It sends INFORM-PDU.

- common arguments  Required. They are: SNMP server IP address and community.
 enterprise-oid  Required, but it can be empty ("").

### Help

#### Help Wizard Information

**Synopsis:** `wiz [--OPTIONS] [--port <port number>]`
Chapter 3 - Additional Features

Note: To directly configure a feature for a specific serial port, use the 
"-port <port number>" option after "wiz -{option}".

Note: Make sure there are two hyphens before any of the options listed on the 
following table.

Table 10: General Options for the Help Wizard

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ac &lt;cas or ts&gt;</td>
<td>Configuration of access method parameters</td>
</tr>
<tr>
<td>al</td>
<td>Configuration of alarm parameter</td>
</tr>
<tr>
<td>all &lt;cas or ts&gt;</td>
<td>Configuration of all parameters</td>
</tr>
<tr>
<td>auth</td>
<td>Configuration of authentication parameters</td>
</tr>
<tr>
<td>db</td>
<td>Configuration of data buffering parameters</td>
</tr>
<tr>
<td>help</td>
<td>Print this help message</td>
</tr>
<tr>
<td>pm</td>
<td>Configuration of power management parameters.</td>

<td>Configuration of serial setting parameters</td>
</tr>
<tr>
<td>tl</td>
<td>Configuration of terminal login display parameters</td>
</tr>
<tr>
<td>tso</td>
<td>Configuration of other parameters specific to the TS profile</td>
</tr>
</tbody>
</table>
Chapter 3 - Additional Features

Step 1: Bring up the wizard.

At the command prompt, type the following to bring up the Help custom wizard
(you can also type wiz -h):

```
wiz --help
```

Help Command Line Interface Information

**Note:** To enter into CLI mode, type `config` at the terminal prompt. You will then get a CLI prompt similar to `config@hostname>>`. Once in CLI mode, you eliminate the need to type `config` at the beginning of your CLI commands. To exit from this mode, type `exit` or `quit`.

Synopsis 1 - Configuration of Port Specific Parameters

```
config configure line [serial port number] [options]
```

or in CLI mode:

```
configure line [serial port number] [options]
```

The following table shows Help CLI Options and the actual parameter modified for Synopsis 1.
### Table 11: Help CLI Options - Synopsis 1

<td>conf.locallogins</td>
</tr>
<tr>
<td>nfsdb &lt;string&gt;</td>
<td>conf.nfs_data_buffering</td>
</tr>
</tbody>
</table>

(Refer to Appendix C for more info on the parameters.)
Chapter 3 - Additional Features

To include spaces within the string you are configuring, encapsulate the string within single or double quotes. For instance, to configure s2.sttc -igncr -onlcr, type (do not put a space after a comma):

```
config configure line 2 sttc "-igncr -onlcr"
```

You can specify the range or list of serial ports if you wish to configure the same parameters for several ports. For instance, to configure parameters for ports 2 through 4, you can type this command: config configure line 2-4 [options]. Or to configure parameters for just ports 4, 6, and 9, you can type:

```
config configure line 4,6,9 [options]
```

(Do not put a space after the commas when listing the serial ports.)

Requesting Help for the CLI

There are two methods for requesting help for the CLI:

- To obtain general help on the format of CLI, type `config help | more` at the terminal prompt.

- Help may be requested at any point in a command by entering a “?” If nothing matches, the help list will be empty and you must backup until entering a “?” shows the available options.

For example:

- To find out possible commands that can come after `config`, type:
  ```
  config ?
  ```

- To find out what parameters are configurable through CLI, type:
  ```
  config configure line <serial port number> ?
  ```
Chapter 3 - Additional Features

NTP

The ntpclient is a Network Time Protocol (RFC-1305) client for UNIX- and Linux-based computers. In order for the AlterPath Console Server to work as a NTP client, the IP address of the NTP server must be set in the file /etc/ntpclient.conf.

The script shell /bin/ntpclient.sh reads the configuration file (/etc/ntpclient.conf) and build the line command to call /bin/ntpclient program.

Parameters Involved and Passed Values
The file /etc/ntpclient.conf has the value of two parameters:

- **NTPSERVER** The IP address of the NTP server.
- **INTERVAL** Check time every interval seconds (default 300).

The data and time will be update from the NPT server according to the parameter options. The ntpclient program has this syntax:

```
ntpclient [options]
```

Options:

- `-c count` Stop after count time measurements (default 0 means go forever).
- `-d` Print diagnostics.
- `-h hostname` NTP server host (mandatory).
- `-i interval` Check time every interval seconds.
- `-l` Attempt to lock local clock to server using adjtimex(2).
- `-p port` Local NTP client UDP port.
- `-r` Replay analysis code based on stdin.
- `-s` Clock set (if count is not defined this sets count to 1).
Chapter 3 - Additional Features

Configuration for CAS, TS, and Dial-in Access

vi Method
Files to be changed:
/etc/ntpclient.conf

Browser Method
To configure NTP with your browser:

Step 1: Point your browser to the ACS.
In the address or location field of your browser type:
(Console Access Server’s IP address>

Step 2: Log in as root and type the Web root password configured by the Web server.
This will take you to the Configuration and Administration page.

Step 3: Click on the Edit Text File link.
Click on this link on the Link Panel or on the Configuration section of the Configuration and Administration page. (See Figure 9: Configuration & Administration Menu page. You can then pull up the appropriate file and edit it.)
Chapter 3 - Additional Features

PCMCIA

**Warning!** Although there are two PCMCIA slots in the ACS, only one is currently supported: the bottom slot. Future software versions will allow for use of the second slot.

**Note:** This section applies only to the model of the AlterPath ACS that has a dual power supply.

**Supported Cards**
The ACS supports the 16-bit PC Cards. The 32-bit CardBus PC Cards are not supported. For an updated list of supported cards, please check the Cyclades Web site.

**Tools for Configuring and Monitoring PCMCIA Devices**
During the ACS boot, the `/etc/init.d/pcmcia` script loads the PCMCIA core drivers and the `cardmgr` daemon. The `cardmgr` daemon is responsible for monitoring PCMCIA sockets, loading client drivers when needed, and running user-level scripts in response to card insertions and removals.

`lsmod`    This command shows the modules loaded for the PCMCIA devices.
`cardctl`  This command can be used to check the status of a socket, or to see how it is configured. Just type `cardctl` to see the syntax of the command. `cardctl config` displays the card configuration, `cardctl ident` can be used to get card identification information. `cardctl eject` stops the application and unloads the client driver, and `cardctl insert` re-loads the driver and re-starts the application.
Chapter 3 - Additional Features

Note: cardctl suspend, cardctl resume and cardctl reset are not supported.

Ejecting Cards
You can insert the card anytime, and the drivers should be loaded automatically. But you will need to run cardctl eject before ejecting the card to stop the application using the card. Otherwise the ACS may hang during the card removal.

Note: Due to a known problem in the current release, the I/O ports used by the card cannot be re-used after card re-insertion. In each card insertion, the card gets a different I/O port. This limits the number of times the card can be ejected and inserted. When all the I/O ports known by the card are used, the RequestIO: No more items message is displayed, and the only way to reset the I/O port usage is to reboot the system.

PCMCIA Network Configuration
The onboard Ethernet device has the eth0 name. When the PCMCIA Ethernet card or wireless LAN card is detected, it will receive the eth1 name.

cardmgr will read the network settings from the /etc/network/interfaces and assign an IP to eth1.

Note: Before changing the /etc/network/interfaces file, unload the network client driver using cardctl eject.
Chapter 3 - Additional Features

The factory default /etc/network/interfaces has the following lines:

```
# auto eth1
# iface eth1 inet static
#    address 192.168.0.42
#    network 192.168.0.0
#    netmask 255.255.255.0
#    broadcast 192.168.0.255
#    gateway 192.168.0.1
```

Remove the # in the beginning of the line, and change the IPs to suit your network configuration. For instance, you may want the following configuration:

```
auto eth1
iface eth1 inet static
    address 192.168.162.10
    network 192.168.162.0
    netmask 255.255.255.0
    broadcast 192.168.162.255
    gateway 192.168.162.1
```

Don't forget to run `saveconf` to save this configuration in the flash, so that it can be restored in the next boot. Run `cardctl insert` to load the network drivers with the new configuration.

**Note:** Do not use `ifconfig` to change the network settings for the PCMCIA device. Otherwise, you may be unable to unload the network driver during `cardctl eject` and the ACS may hang. The correct way is to change the `/etc/network/interfaces` file.
Chapter 3 - Additional Features

Wireless LAN PC Cards

The configuration of the driver is done in the following file:

/etc/pcmcia/wireless.opts

For instance, to configure the network name as MyPrivateNet, and the WEP encryption key as secul, the following settings could be added to the default "*,*,*,*)" entry:

```
*,*,*,*)
INFO="This is a test"
ESSID="MyPrivateNet"
KEY="s:secul"
```

**Note:** The "s:" prefix in the KEY line indicates that the key is an ASCII string, as opposed to hex digits. Five characters or ten digits could be entered for WEP 40-bit and 13 characters or 26 digits could be entered for WEP 128-bit.

There is a generic sample in the end of the wireless.opts file that explains all possible settings. For more details in wireless configuration, search for manpage iwconfig on the Internet. The parameters in wireless.opts are used by the iwconfig utility. After changing any of the parameters, run cardctl eject followed by cardctl insert to load the new settings. Also, run saveconf to save the new settings to flash. iwconfig eth1 shows the basic wireless parameters set in eth1. iwlist allows to list frequencies, bit-rates, encryption, etc. The usage is:

```
iwlist eth1 frequency
iwlist eth1 channel
iwlist eth1 ap
iwlist eth1 accesspoints
iwlist eth1 bitrate
iwlist eth1 rate
iwlist eth1 encryption
```
Chapter 3 - Additional Features

iwlist eth1 key
iwlist eth1 power
iwlist eth1 txpower
iwlist eth1 retry

Modem PC Cards

The modem device gets the /dev/ttySn name, where n is the number of embedded serial devices plus 1. For instance, if the ACS has 32 onboard serial devices, the modem card becomes the /dev/ttyS33.

When a modem card is detected, cardmgr starts a script which loads mgetty for the modem device automatically. mgetty provides the login screen to the remote user. mgetty may also be configured to start PPP (pppd) and let PPP login the caller. The steps to allow PPP connections are:

Step 1: Enable authentication.
Enable the desired authentication in /etc/mgetty/login.config. For instance, you may want the following authentication in /etc/mgetty/login.config to enable PAP and system password database authentication:

/AutoPPP/ a_ppp /usr/local/sbin/pppd auth -chap +pap login nobsdcomp nodeflate

Step 2: Create a user name.
If +pap authentication was selected, create a user name in /etc/ppp/pap-secrets. For instance, you may add the following line:

"mary" * "marypassword" *

Step 3: Run adduser.
If login authentication was also selected, run adduser to create the same user in /etc/passwd.
Chapter 3 - Additional Features

Step 4: Copy the /etc/ppp/options.ttyXX.
Copy the /etc/ppp/options.ttyXX to have the device name assigned to the pcmcia modem. For instance, if the modem is the ttyS33, /etc/ppp/options.ttyXX should be copied as /etc/ppp/options.ttyS33. If you are not sure which ttySxx is the modem device, do a "ls -al /dev/modem" with the modem inserted.

Step 5: Uncomment local and remote IP assignment line.
Uncomment the line that assigns the local and remote IPs in /etc/ppp/options.ttyS33 (or whatever is the tty name in your system). For instance, you may want to assign 192.168.0.1 for local ip, and 192.168.0.2 for the remote ip.

Step 6: Create an entry in /etc/config_files.
It should have the name of the file you created, so that the new file can be saved to the flash. For instance, you will have to add a line with /etc/ppp/options.ttyS33 in /etc/config_files.

Step 7: Run saveconf to save the files listed in /etc/config_files to the flash.

Step 8: Insert the pcmcia modem if not inserted yet.

Step 9: Run ps to see that mgetty is running.
The ACS is ready to receive dial in calls.

Step 10: Establish PPP connection with the ACS.
From the remote system, use pppd to dial and establish a PPP connection with the ACS. The remote system should have the login user name set in their /etc/ppp/pap-secrets to have a successful login in the ACS.

Establishing a Callback with your Modem PC Card
Setting up a callback system serves two purposes:
1. Cost savings: reversing line charges - allows your company to call you back.
2. Security: makes sure users are who they pretend to be by calling a well-known or preconfigured number back.
Chapter 3 - Additional Features

The steps to allow callback are divided into two parts. Part One is the configuration for the ACS (Server Side ACS Setup). Part Two is the configuration for the client side.

Server Side ACS Setup

**Step 1: Enable authentication.**

Enable the desired authentication in /etc/mgetty/login.config. For instance, you may want the following authentication in /etc/mgetty/login.config to enable PAP and system password database authentication:

```
/AutoPPP/ -a_ppp /usr/local/sbin/pppd auth -chap +pap login
nobsdcomp nodeflate
```

**Step 2: Configure a pseudo callback user.**

Add the following line to /etc/mgetty/login.config with the appropriate values. Do this before the line /* - - /bin/login @/* at the end of the file.

```
<pseudo callback name> - - /sbin/callback -S <phone number of the client>/
```

ie:

```
call - - /sbin/callback -S 12345
```

'call' is the pseudo callback name. '123456' is the number to dial back.
Chapter 3 - Additional Features

Note:

1. The order of configuration in `/etc/mgetty/login.config` matters. By default, it has the line `*     -     -     /bin/login @` at the end of the file. This line allows any users to log in and be verified by the `login` program. If you were to add the callback line after this line, the callback program will not be initiated when you try logging in. Instead, the `login` program will be used to verify you since it was encountered first. List the callback users first if you want the option of having some users access the callback program and the others the `login` program.

```
call     -     -     /sbin/callback -S 12345

call2    -     -     /sbin/callback -S 77777

*     -     -     /bin/login @
```

The example above will allow you to have the option whether or not you want to use the callback functionality. If you log in with `call` or `call2`, then callback starts immediately. If you log in as anybody else other than `call` or `call2`, callback will not start and you'll be verified by the `login` program.

2. Don't use `*` instead of some callback user name. `Mgetty` will fall to infinite callback.

3. If you don't specify a telephone number, callback will ask for a number after you log in as the pseudo callback user.

Step 3: (If you plan to login through PPP with PAP authentication) create pap user name in `/etc/ppp/pap-secrets`.

Add a line similar to the following: (include the quotes and the two asterisks).

```
"myUserName"     *     "myUserNamePassword"*
```

Step 4: (If you plan to login through PPP) follow steps 4 - 9 in the section above on Modem PC Cards.
Chapter 3 - Additional Features

Step 5: Create users.

Step A: Create a new user with the command `adduser myUserName`.
This will create an entry in `/etc/passwd` that resembles this:

```
myUserName:$1$/3Qc1pGe$./h3hzkaJQJ/:503:503:Embedix
User,.,,:/home/myUserName:/bin/sh
```

Step B: If you want to limit myUserName to getting ONLY PPP access and NOT shell access to the server, edit the entry for myUserName in `/etc/passwd`.
Do this by replacing `/bin/sh` with a pathname to a script that you will be creating later. In the following example, the script is: `/usr/ppp/ppplogin`

```
myUserName:$1$/3Qc1pGe$./h3hzkaJQJ/:503:503:Embedix
User,.,,:/home/myUserName:/usr/ppp/ppplogin
```

Step 6: If you executed Step 5b, create the ppp login script.

Step A: Create a script called `/etc/ppp/ppplogin` following this format:

```
#!/bin/sh
exec /usr/local/sbin/pppd <ppp options>
```

Step B: Make script executable.
Type `chmod 755 /etc/ppp/ppplogin`.

Step C: Save this file to flash.
Save this file to flash so the next time the ACS gets rebooted, you won't lose the new file. Add `/etc/ppp/ppplogin` into `/etc/config_files`. Now execute `saveconf`.

Step 7: Change permission of pppd.
Type `chmod u+s /usr/local/sbin/pppd`
Chapter 3 - Additional Features

Tip. To prevent from always having to manually change permission every time your ACS reboots:
1. Edit /etc/users_scripts by uncommenting the following line:
   
   ```bash
   /bin/chmod_pppd
   ```
2. Add /etc/users_scripts into /etc/config_files.
3. Execute `saveconf`. The next time the ACS reboots, this change will be in effect. You should not need to manually change the pppd permission.

Step 8: Your ACS is ready to establish a callback connection.
See Client Side Setup to start the callback connection.

Client Side Setup

Step 1: Activate Show Terminal Window option.
(From Win2000) Go to your Connection window (the window to dial the ACS) -> Properties -> Security -> look for Interactive Logon and Scripting -> click on Show Terminal Window.

Step 2: Disable/enable encryption protocols.
If you are going to be using PPP connection with PAP authentication, make sure you disable all other encryption protocols.
(from Win2000) go to your Connection window (the window to dial the ACS) -> Properties -> Security -> click on Advanced (custom settings) -> click on Settings -> click on Allow these protocols -> disable all protocols except the PAP one.

Step 3: Set up modem init string.
It is very important that before callback hangs the call, the modem in the Windows box does not tell Windows that the call has been dropped. Otherwise, Windows Dial-up Networking will abort everything (because it thinks the call was dropped with no reason).
Chapter 3 - Additional Features

(From Win2000) Go to Windows' control panel -> Phone and Modem -> Modems -> choose your modem -> Properties -> Advanced -> add &c0s0=1 to Extra Settings.

Step 4: Call your ACS.

   Step A: Dial to the ACS modem using either the normal username or the ppp username that you created in Step 5 when configuring the server side.

   Step B: Once a connection is made, you get a login prompt.

   Step C: Login with the pseudo callback name to start the callback.

   Step D: Your connection gets dropped. ACS is now calling you back.

   Step E: After reconnection to you, you get a login prompt again.

   Step F: Now you can:

   • Log in through character mode: Log in with username and password. You will get the ACS shell prompt.

   • Log in through ppp: Click on Done on the Terminal Window.

ISDN PC Cards

You can establish synchronous PPP connections with ISDN cards. The ipppd is the daemon that handles the synchronous PPP connections.

How to configure dial in

Step 1: Create a user.

Create a user in /etc/ppp/pap-secrets or in /etc/ppp/chap-secrets, depending if you want PAP or CHAP authentication. You will also have to create a user in /etc/ppp/pap-secrets if you want radius or local authentication. In case you don't want to repeat all the user database from the radius server an option is to use "*" as the user in /etc/ppp/pap-secrets:

```
* * * * * * * *
```

Step 2: Change the options in /etc/pcmcia/isdn.opts to fit your environment.

Make sure that $DIALIN is set to "yes." Set the desired authentication in DIALIN_AUTHENTICATION. For instance,
Chapter 3 - Additional Features

"+pap" for PAP, "+chap" for CHAP, "login auth" or "login +pap" for radius, "login auth" or "login +pap" for local. When “login auth” or “login +pap” are used, PAM libraries are used so /etc/pam.conf should be also configured.

Step 3: Run saveconf to save your changes to the flash.

Step 4: If the ISDN card is not inserted, it is time to insert the card.
   ipppd is started automatically. Go to step 6.

Step 5: Restart script.
   If the card was already inserted, you will need to restart the isdn script to re-load any changed configuration. To restart the script, issue:
   
   /etc/pcmcia/isdn stop ippp0

   /etc/pcmcia/isdn start ippp0

Step 6: You can dial from the remote system to the ACS, and get a PPP connection.

Step 7: To hang up the connection from the ACS side, just issue:
   
   isdnctrl hangup ippp0

How to configure dial out

Step 1: Create a user.
   Create a user in /etc/ppp/pap-secrets or in /etc/ppp/chap-secrets, depending if you want PAP or CHAP authentication.

Step 2: Change options.
   Change the options in /etc/pcmcia/isdn.opts to fit your environment. Make sure that $DIALIN is set to "no". Set $USERNAME to the user name provided by your ISP.

Step 3: Run saveconf to save your changes to the flash.

Step 4: If the ISDN card is not inserted, it is time to insert the card.
   ipppd is started automatically. Go to step 6.
Chapter 3 - Additional Features

Step 5: Restart script.
If the card was already inserted, you will need to restart the isdn script to re-load any changed configuration. To restart the script, issue:

/etc/pcmcia/isdn stop ippp0
/etc/pcmcia/isdn start ippp0

Step 6: To dial out, issue the command:

isdnctrl dial ippp0

Step 7: To hangup the connection from the ACS side, just issue:

isdnctrl hangup ippp0

Establishing a Callback with your ISDN PC Card

For the same cost saving reasons explained in Establishing a Callback with your Modem PC Card, the ISDN card in the ACS can be configured to callback client machines after receiving dial in calls.

The steps to allow callback are divided into two parts. Part One is the configuration for the ACS (ACS Setup) as callback server. Part Two is the configuration of a Windows 2000 Professional computer as callback client.

ACS setup (Callback Server)

Step 1: Change the parameters in /etc/pcmcia/isdn.opts to fit your environment.

Step 2: Set the callback number in DIALOUT_REMOTENUMBER:

DIALOUT_REMOTENUMBER="8358662" # Remote phone that you want to # dial to
Chapter 3 - Additional Features

Step 3: If your isdn line supports caller id, it is recommended that you also configure the DIALIN_REMOTENUMBER and enable secure calls. Otherwise skip to step 4.

DIALIN_REMOTENUMBER="8358662" # Remote phone from which you will receive calls
SECURE="on" # "on" = incoming calls accepted only if remote phone matches DIALIN_REMOTENUMBER; "off" = # accepts calls from any phone. "on" will work only if your line has the caller id info.

Step 4: Make sure the CALLBACK is set to “in” in /etc/pcmcia/isdn.opts.

Step 5: CALLBACK="in" # "in" will enable callback for incoming calls.
   Uncomment line with user "mary" in /etc/ppp/pap-secrets.

Step 6: Activate the changes by stopping and starting the isdn script:
   /etc/pcmcia/isdn stop ippp0
   /etc/pcmcia/isdn start ippp0

   The ACS side is done.

Windows 2000 Professional configuration (Callback Client)

Step 1: Create user “mary” with password “marypasswd” in Control Panel -> "User and Passwords".

Step 2: Create a dial-up connection that uses “Modem - AVM ISDN Internet (PPP over ISDN) (AVMISDN1)".
   (To create a dial-up connection, go to Start->Settings->Network and Dial-up Connections->Make New Connection, select “I want to set up my Internet connection manually, or I want to connect through a local area network”, select “I connect through a phone line and a modem”, select the “AVM ISDN Internet (PPP over ISDN)" modem, type the phone number you dial to connect to the ACS, and enter mary as User name and marypasswd as password.). After creating this dial-up,
Chapter 3 - Additional Features

click on the Properties of this dial-up, select the “Options” panel, and change the Redial attempts to 0.

**Step 3: Accept incoming connections.**

To accept incoming connections, go to Start->Settings->Network and Dial-up Connections->Make New Connection, select “Accept incoming connections” (the words are slightly different in XP), select AVM ISDN Internet (PPP over ISDN), select “Do not allow virtual private connections”, click the user “mary”, then click on Properties of TCP/IP to specify the IP addresses for the calling computers. Also in “mary” Properties, select the Callback tab and make sure the option “Do not allow callback” is selected. After any change in the Incoming Connection Properties, it is recommended that the Windows is rebooted to apply the changes.

The Windows side is done.

Now you can dial from Windows to the ACS. Go to Start->Settings-> “Network and Dial-up Connections” and select the dial-up that you created. After the “Dialing” message, you will see a window with a warning message:

*Opening port....*  
*Error 676: The phone line is busy.*

Just click Cancel. In a few seconds, the ACS will call you back, and you will see the connection icon in the taskbar.

**Establishing a Callback with your ISDN PC Card (2nd way)**

The previous section explained how to do callback at D-Channel level. The advantages of having callback at D-Channel level is that it works independent of the Operating System on the client side. But a big disadvantage is that the callback call happens before the authentication phase in PPP. The only security is by that only calls from predefined phone numbers are accepted.

To fix that drawback, this section explains another way to have callback with the ACS. The steps described here will work when the remote side is a UNIX machine, not Windows. The callback call will happen after the PPP authentication is successful.
Chapter 3 - Additional Features

ACS setup (Callback Server)

Step 1: Change the parameters in /etc/pcmcia/isdn.opts to fit your environment.
Step 1.1: Set the callback number in DIALOUT_REMOTENUMBER.

DIALOUT_REMOTENUMBER="8358662" # Remote phone that you want to
    # dial to

Step 1.2: Configure the DIALIN_REMOTENUMBER.
If your ISDN line supports caller id, it is recommended that you also configure the
DIALIN_REMOTENUMBER and enable secure calls. Otherwise skip to Step 1.3.

DIALIN_REMOTENUMBER="8358662" # Remote phone from which you will
    # receive calls

SECURE="on" # "on" = incoming calls accepted only if remote
    # phone matches DIALIN_REMOTENUMBER; "off" =
    # accepts calls from any phone. "on" will work
    # only if your line has the caller id info.

Step 1.3: Set the desired IPs for local and remote machines.
Set DIALIN to "yes".

DIALIN="yes" # "yes" if you want dial in, "no" if you want dial out

Step 1.4: Make sure the CALLBACK parameter is disabled.

CALLBACK="off" # "off" = callback disabled.

Step 1.6: Add the user that will callback the client in DIALIN_AUTHENTICATION.

DIALIN_AUTHENTICATION="auth login user mary"

Step 2: Make sure /etc/pam.conf has the configuration you want (e.g., radius).
This step is only required if you are using “auth login” in DIALIN_AUTHENTICATION.
When using “auth login,” /etc/pam.conf is what defines which authentication will be used.
Chapter 3 - Additional Features

Step 3: Add the user "mary" in /etc/ppp/pap-secrets.

Step 4: Uncomment lines in /etc/ppp/auth-up.

Step 5: Activate the changes by stopping and starting the isdn script:

/etc/pcmcia/isdn stop ippp0
/etc/pcmcia/isdn start ippp0

Linux (Callback Client)

Step 1: Configure the ipppd to have user mary and pap authentication.

Step 2: Dial to the ACS:

    isdnctrl dial ippp0

Step 3: As soon the ACS authenticates the user mary, the ACS will disconnect and callback.
Chapter 3 - Additional Features

Ports Configured as Terminal Servers

There are TS-specific parameters that are required to be configured when using the serial ports with the TS profile. The configuration of these TS-specific parameters are described in this section. Additional configuration for TS is described in Access Method and Serial Settings in Chapter 3, and in Appendix C – The pslave Configuration File.

TS Setup Wizard

The Wizard can be used to configure TS-specific parameters. (TSO stands for “TS Other”—other parameters specific to the TS profile):

Step 1: At the command line interface type the following:

```
wiz --tso
```

Screen 1:

```
***********************************************************
******** *CONFIGURATION WIZARD ********
***********************************************************

INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system
   and press ENTER. Enter '#' if you want to
deactivate that parameter or
2) Press ENTER if you are satisfied with the value
   within the brackets [ ] and want to go on to the
   next parameter or
3) Press ESC if you want to exit.

NOTE: For some parameters, if there is nothing within
the brackets, it will continue to ask for a value.
In that case, you must enter a valid value or # if you
do not wish to configure the value.

Press ENTER to continue...
Chapter 3 - Additional Features

Screen 2:

******************************************************************************
******** CONFIGURATION WIZARD ********
******************************************************************************

Current configuration:
(The ones with the '#' means it's not activated.)

all.host : 192.168.160.8
all.term : vt100
conf.locallogins : 0

Set to defaults? (y/n) [n] :

Screen 3:

******************************************************************************
******** CONFIGURATION WIZARD ********
******************************************************************************

ALL.HOST - The IP address of the host to which the terminals will connect.

all.host[192.168.160.8] :

ALL.TERM - This parameter defines the terminal type assumed when performing rlogin or telnet to other hosts.

all.term[vt100] :

Screen 4:

******************************************************************************
******** CONFIGURATION WIZARD ********
******************************************************************************

CONF.LOCALLOGINS - This parameter is only necessary when authentication is being performed for a port. When set to 1, it is possible to log into the system directly by placing a '!' before users' login name, then using their
Chapter 3 - Additional Features

normal password. This is useful if the Radius authentica-
tion server is down.

conf.locallogins[0] :

Screen 5:

***********************************************************
******** **CONFIGURATION WIZARD ********
***********************************************************
Current configuration:
(The ones with the '#' means it's not activated.)

all.host : 192.168.160.8
all.term : vt100
conf.locallogins : 0

Are these configuration(s) all correct? (y/n) [n] :

If you type 'n'
Type 'c' to go back and CORRECT these parameters
or 'q' to QUIT :
Typing 'c' repeats the application, typing 'q' exits the entire wiz application

If you type 'y'
Discard previous port-specific parameters? (y/n) [n] :

Note: Answering yes to this question will discard only the parameter(s) which
you are currently configuring if they were configured for a specific port in a
previous session. For instance, if you are currently configuring parameter, all.x,
and there was a specific port, s2.x, configured; then, answering yes to this
question will discard s2.x.

Type 'c' to CONTINUE to set these parameters for
specific ports or 'q' to QUIT:
Chapter 3 - Additional Features

Typing 'c' leads to Screen 6, typing 'q' leads to Screen 7.

Screen 6:
***********************************************************
*********CONFIGURATION WIZARD *********
***********************************************************

You have 8 available ports on this system.
Type 'q' to quit, a valid port number[1-8], or anything else to refresh:

Tip. The number of available ports depends on the system you are on. Typing in a valid port number repeats this program except this time it's configuring for the port number you have chosen. Typing 'q' leads to Screen 7.

Screen 7:
***********************************************************
*********CONFIGURATION WIZARD *********
***********************************************************

(Note: If you are NOT connected to this unit through a console, and you have just reconfigured the IP of this unit, activating the new configurations may cause you to lose connection. In that case, please reconnect to the unit by the new IP address, and manually issue a saveconf to save your configurations to flash.)

Do you want to activate your configurations now? (y/n) [n]:

Chapter 3 - Additional Features

Screen 8:
***********************************************************
********* CONFIGURATION WIZARD ***********
***********************************************************

Flash refers to a type of memory that can be erased and reprogrammed in units of memory known as blocks rather than one byte at a time; thus, making updating to memory easier.

If you choose to save to flash, your configurations thus far will still be in the memory of the system even after you reboot it. If you don't save to flash and if you were to reboot the system, all your new configurations will be lost and you will have to reconfigure the system.

Do you want to save your configurations to flash? (y/n) [n] :

CLI Method
To configure certain parameters for a specific serial port:

Step 1: At the command prompt, type in the appropriate command to configure desired parameters.
To activate the serial port. <string> should be ttyS<serial port number>:

    config configure line <serial port number> tty <string>

To configure host:

    config configure line <serial port number> host <string>

To configure term:

    config configure line <serial port number> term <string>

To configure conf.locallogins:

    config configure conf locallogins <number>
Chapter 3 - Additional Features

Step 2: Activate and Save.
To activate your new configurations and save them to flash, type:

```
config write
```

(This is essentially typing `signal_ras hup` and `saveconf` from the normal terminal prompt.)

Serial Settings
This feature controls the speed, data size, parity, and stop bits of all ports. It also sets the flow control to hardware, software, or none; the DCD signal; and tty settings after a socket connection to that serial port is established.

Parameters Involved and Passed Values
Terminal Settings involve the following parameters (the first four are physical parameters):

- **all.speed**: The speed for all ports. Default value: 9600.
- **all.datasize**: The data size for all ports. Default value: 8.
- **all.stopbits**: The number of stop bits for all ports. Default value: 1.
- **all.parity**: The parity for all ports. Default value: none.

Tip: You can configure all the parameters for a serial port in one line.

```
config configure line <serial port number> tty <string> host <string> term <string> locallogins <number>
```
### Chapter 3 - Additional Features

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all.flow</td>
<td>This sets the flow control to hardware, software, or none. Default value: none.</td>
</tr>
<tr>
<td>all.dcd</td>
<td>DCD signal (sets the tty parameter CLOCAL). Valid values are 0 or 1. If all.dcd=0, a connection request will be accepted regardless of the DCD signal and the connection will not be closed if the DCD signal is set to DOWN. If all.dcd=1 a connection request will be accepted only if the DCD signal is UP and the connection will be closed if the DCD signal is set to DOWN. Default value: 0.</td>
</tr>
</tbody>
</table>
| all.sttyCmd (for CAS only) | The TTY is programmed to work as configured and this user-specific configuration is applied over that serial port. Parameters must be separated by a space. The following example sets:  
-igncr  
This tells the terminal not to ignore the carriage-return on input,  
-onlcr  
Do not map newline character to a carriage return or newline character sequence on output,  
opost  
Post-process output,  
-icrnl  
Do not map carriage-return to a newline character on input.  

   all.sttyCmd -igncr -onlcr opost -icrnl

| DTR_reset (for CAS only) | This parameter specifies the behavior of the DTR signal in the serial port. If set to zero the DTR signal will be ON if there is a connection to the serial port, otherwise OFF. If set from 1 to 99 the DTR signal will be always ON. A value greater or equal 100 specifies for how long (in milliseconds) the DTR signal will be turned off before it is turned back on again when a connection to the serial port is closed. |
Chapter 3 - Additional Features

Configuration for CAS

Browser Method

Step 1: Point your browser to the ACS.
In the address or location field of your browser type:

<Console Access Server’s IP address>

Step 2: Log in as root and type the Web root password configured by the Web server.
This will take you to the Configuration and Administration page.

Step 3: Select the Serial Ports link.
Click on the Serial Ports link on the Link Panel to the left of the page or in the Configuration section of the page. This will take you to the Port Selection page.

Step 4: Select port(s).
On the Port Selection page, choose all ports or an individual port to configure, from the dropdown menu. Click the Submit button. This will take you to the Serial Port Configuration page.

Step 5: Click the “CAS Profile” button.

Step 6: Scroll down to the Physical section.
You can change the settings for Speed, Data Size, Stop Bit, Parity, Flow Control, and DCD-sensitivity here.

Step 7: Click on the Submit button.

Step 8: Make the changes effective.
Click on the Administration > Run Configuration link, check the Serial Ports/Ethernet/Static Routes box and click on the Activate Configuration button.

Step 9: Click on the link Administration > Load/Save Configuration.

Step 10: Click the Save Configuration to Flash button.
The configuration was saved in flash.
Chapter 3 - Additional Features

Wizard Method

**Step 1: Bring up the wizard.**

At the command prompt, type the following to bring up the CAS Terminal Settings custom wizard:

```
wiz --sset cas
```

Screen 1 will appear.

**Screen 1:**

```
***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system and press ENTER. Enter '#' if you want to deactivate that parameter or
2) Press ENTER if you are satisfied with the value within the brackets [ ] and want to go on to the next parameter or
3) Press ESC if you want to exit.

NOTE: For some parameters, if there is nothing within the brackets, it will continue to ask for a value. In that case, you must enter a valid value or # if you do not wish to configure the value.

Press ENTER to continue...
Chapter 3 - Additional Features

Step 2: Activate and Save.
To activate your new configurations and save them to flash, type:

config write

(This is essentially typing signal_ras hup and saveconf from the normal terminal prompt.)
Chapter 3 - Additional Features

Configuration for Dial-in Access

Browser Method
See the browser method for the CAS, earlier in this section. The only difference for Dial-in is that the “Dial-in Profile“ button should be clicked in Step 5.

CLI Method
To configure line parameters for a specific serial port:

**Step 1:** At the command prompt, type in the appropriate command to configure desired parameters.

- To activate the serial port. `<string>` should be `ttyS<serial port number>`:
  
  `config configure line <serial port number> tty <string>`

- To configure speed:
  
  `config configure line <serial port number> speed <number>`

- To configure datasize:
  
  `config configure line <serial port number> datasize <number>`

- To configure stopbits:
  
  `config configure line <serial port number> stopbits <number>`
Chapter 3 - Additional Features

Session Sniffing

Versions 2.1.0 and later

You can open more than one common and sniff session at the same port. For this purpose, the following configuration items are available in the file pslave.conf:

- all.multiple_sessions: If it is configured as no, only two users can connect to the same port simultaneously. If it is configured as yes, more than two simultaneous users can connect to the same serial port. A “Sniffer menu” will be presented to the user and they can choose either to open a sniff session; to open a read and/or write session; to cancel a connection; or to send a message to other users connected to the same serial port. If it is configured as “RW_sessions,” only read and/or write sessions will be opened, and the sniffer menu won’t be presented. If it is configured as “sniff_session” only, a sniff session will be opened, and the sniffer menu won’t be presented. Default value: no.

- sN.multiple_sessions: Valid only for port N. If it is not defined, it will assume the value of all.multiple_sessions.

- all.escape_char: Valid for all the serial ports; this parameter will be used to present the menus below to the user. Only characters from ‘^a’ to ‘^z’ (i.e., CTRL-A to CTRL-Z) will be accepted. The default value is ‘^z’ (CTRL-Z).

- sN.escape_char: Valid only for port N; this parameter will be used to present the menus below to the user. Only characters from ‘^a’ to ‘^z’ (i.e. CTRL-A to CTRL-Z) will be accepted. If it is not defined, it will assume the value of all.escape_char.

When multiple sessions are allowed for one port, the behavior of the AlterPath Console Server will be as follows:

1. The first user to connect to the port will open a common session.

2. From the second connection on, only admin users will be allowed to connect to that port. The AlterPath Console Server will send the following menu to these administrators (defined by the parameter all.admin_users or sN.admin_users in the file pslave.conf):

   * * * ttySN is being used by (<first_user_name>) !!!
Chapter 3 - Additional Features

* 

1 - Initiate a regular session
2 - Initiate a sniff session
3 - Send messages to another user
4 - Kill session(s)
5 - Quit

Enter your option:

If the user selects 1 - Initiate a regular session, s/he will share that serial port with the users that were previously connected. S/he will read everything that is received by the serial port, and will also be able to write to it.

If the user selects 2 - Initiate a sniff session, s/he will start reading everything that is sent and/or received by the serial port, according to the parameter all.sniff_mode or sN.sniff_mode (that can be in, out or i/o).

When the user selects 3 - Send messages to another user, the AlterPath Console Server will send the user's messages to all the sessions, but not to the tty port. Everyone connected to that port will see all the "conversation" that's going on, as if they were physically in front of the console in the same room. These messages will be formatted as:

[Message from user/PID] <<message text goes here>> by the ACS

To inform the AlterPath Console Server that the message is to be sent to the serial port or not, the user will have to use the menu.

If the administrator chooses the option 4 - Kill session(s), the AlterPath Console Server will show him/her a list of the pairs PID/user_name, and s/he will be able to select one session typing its PID, or "all" to kill all the sessions. If the administrator kills all the regular sessions, his session initiates as a regular session automatically.

Option 5 - Quit will close the current session and the TCP connection.
Chapter 3 - Additional Features

Only for the administrator users:
Typing `all.escape_char` or `sN.escape_char` from the sniff session or “send message mode” will make the ACS show the previous menu. The first regular sessions will not be allowed to return to the menu. If you kill all regular sessions using the option 4, your session initiates as a regular session automatically.

Parameters Involved and Passed Values

Sniffing involves the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all.admin_users</td>
<td>This parameter determines which users can receive the sniff menu. When users want access per port to be controlled by administrators, this parameter is obligatory and authtype must not be none. User groups (defined with the parameter conf.group) can be used in combination with user names in the parameter list. Example values: peter, john, user_group.</td>
</tr>
<tr>
<td>all.sniff_mode</td>
<td>This parameter determines what other users connected to the very same port (see parameter admin_users below) can see of the session of the first connected user (main session): in shows data written to the port, out shows data received from the port, and i/o shows both streams. The second and later sessions are called sniff sessions and this feature is activated whenever the protocol parameter is set to socket_ssh or socket_server. Example value: out.</td>
</tr>
<tr>
<td>all.escape_char</td>
<td>This parameter determines which character must be typed to make the session enter menu mode. The possible values are <code>&lt;CTRL-a&gt;</code> to <code>&lt;CTRL-z&gt;</code>. Represent the CTRL with carat: <code>^</code>. This parameter is only valid when the port protocol is socket_server or socket_ssh. Default value is <code>^z</code>.</td>
</tr>
</tbody>
</table>
Chapter 3 - Additional Features

all.multiple_sessions  If it is configured as no, only two users can connect to the same port simultaneously. If it is configured as yes, more than two simultaneous users can connect to the same serial port. A “Sniffer menu” will be presented to the user and they can choose either to open a sniff session; to open a read and/or write session; to cancel a connection; or to send a message to other users connected to the same serial port. If it is configured as “RW_sessions,” only read and/or write sessions will be opened, and the sniffer menu won’t be presented. If it is configured as “sniff_session” only, a sniff session will be opened, and the sniffer menu won’t be presented. Default value: no.

Configuration for CAS

vi Method
Only the file /etc/portslave/pslave.conf has to be changed.

Browser Method
To configure Session Sniffing with your browser:

Step 1:  Point your browser to the ACS.
In the address or location field of your browser type:

<Console Access Server’s IP address>

Step 2:  Log in as root and type the Web root password configured by the Web server.
This will take you to the Configuration and Administration page.

Step 3:  Select the Serial Ports link.
Click on the Serial Ports link on the Link Panel to the left of the page or in the Configuration section of the page. This will take you to the Port Selection page.

Step 4:  Select port(s).
On the Port Selection page, choose all ports or an individual port to configure, from the dropdown menu. Click the Submit button. This will take you to the Serial Port Configuration page.
Step 5: Scroll down to the Sniff Session section.
You can configure the appropriate values here.

<table>
<thead>
<tr>
<th>Sniff Session Mode:</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrative Users:</td>
<td></td>
</tr>
<tr>
<td>Escape char from sniff mode:</td>
<td></td>
</tr>
<tr>
<td>Allows multiple sniff sessions:</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Figure 30: Sniff Session section of the Serial Port Configuration page

Step 6: Click on the Submit button.

Step 7: Make the changes effective.
Click on the Administration > Run Configuration link, check the Serial Ports/Ethernet/Static Routes box and click on the Activate Configuration button.

Step 8: Click on the link Administration > Load/Save Configuration.

Step 9: Click the Save Configuration to Flash button.
The configuration was saved in flash.

Wizard Method

Step 1: Bring up the wizard.
At the command prompt, type the following to bring up the Sniffing custom wizard:

```
wiz --snf
```
Chapter 3 - Additional Features

Screen 1:

***********************************************************************
********* CONFIGURATION WIZARD **********
***********************************************************************

INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system and press ENTER. Enter '#' if you want to deactivate that parameter or
2) Press ENTER if you are satisfied with the value within the brackets [ ] and want to go on to the next parameter or
3) Press ESC if you want to exit.

NOTE: For some parameters, if there is nothing within the brackets, it will continue to ask for a value. In that case, you must enter a valid value or '#' if you do not wish to configure the value.

Press ENTER to continue...

Screen 2:

***********************************************************************
********* CONFIGURATION WIZARD **********
***********************************************************************

Current configuration:
(The ones with the '#' means it's not activated.)

all.admin_users : #
all.sniff_mode : out
all.escape_char : ^z
all.multiple_sessions : no

Set to defaults? (y/n) [n] : 
Screen 3:

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

ALL.ADMIN_USERS - This parameter determines which users can open a sniff session, which is where other users connected to the very same port can see everything that the first user is doing. The other users connected to the very same port can also cancel the first user's session (and take over). If the parameter, all.multiple_sessions, is configured as 'no', then only two users can connect to the same port simultaneously. If it is configured as 'yes', more simultaneous users can sniff the session or have read/write permissions.
(Please see details in Session Sniffing in Chapter 3 of the system's manual.)

all.admin_users[#] :

ALL.SNIFF_MODE - This parameter determines what other users connected to the very same port can see of the session of the first connected user (main session). The second session is called a sniff session and this feature is activated whenever the protocol is set to socket_ssh or socket_server.
(e.g. in - shows data written to the port, out - shows data received from the port, i/o - shows both streams.)

all.sniff_mode[out] :
Chapter 3 - Additional Features

Screen 4:

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

ALL.ESCAPE_CHAR - This parameter determines which character must be typed to make the session enter into "menu mode." The possible values are <CRTL-a> to <CRTL-z>, and this is only valid when the port protocol is socket_server or socket_ssh. Represent the CRTL character with '^'. Default value is ^z.

all.escape_char[^z] :

ALL.MULTIPLE_SESSIONS - Allows users to open multiple common and sniff sessions on the same port. The options are "yes," "no," "RW_session," or "sniff_session."
Default is set to "no."

all.multiple_sessions[no] :

Screen 5:

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

Current configuration:
(The ones with the '#' means it's not activated.)

all.admin_users : #
all.sniff_mode : out
all.escape_char : ^z
all.multiple_sessions : no

Are these configuration(s) all correct? (y/n) [n] :
Chapter 3 - Additional Features

If you type 'N'
Type 'c' to go back and CORRECT these parameters
or 'q' to QUIT :
Typing 'c' repeats the application, typing 'q' exits the entire wiz application

If you type 'Y'
Discard previous port-specific parameters? (y/n) [n] :

Note: Answering yes to this question will discard only the parameter(s) which you are currently configuring if they were configured for a specific port in a previous session. For instance, if you are currently configuring parameter, all.x, and there was a specific port, s2.x, configured; then, answering yes to this question will discard s2.x.

Type 'c' to CONTINUE to set these parameters for specific ports or 'q' to QUIT :

Typing 'c' leads to Screen 6, typing 'q' leads to Screen 7.

Screen 6:
***********************************************************
*********CONFIGURATION WIZARD *********
***********************************************************
You have 8 available ports on this system.

Type 'q' to quit, a valid port number[1-8], or anything else to refresh :

Note: The number of available ports depends on the system you are on. Typing in a valid port number repeats this program except this time it's configuring for the port number you have chosen. Typing 'q' leads to Screen 7.
Chapter 3 - Additional Features

Screen 7:
***********************************************************
******** **CONFIGURATION WIZARD ********
***********************************************************

(Note: If you are NOT connected to this unit through a console, and you have just reconfigured the IP of this unit, activating the new configurations may cause you to lose connection. In that case, please reconnect to the unit by the new IP address, and manually issue a saveconf to save your configurations to flash.)

Do you want to activate your configurations now? (y/n) [y] :

Screen 8:
***********************************************************
******** **CONFIGURATION WIZARD ********
***********************************************************

Flash refers to a type of memory that can be erased and reprogrammed in units of memory known as blocks rather than one byte at a time; thus, making updating to memory easier.

If you choose to save to flash, your configurations thus far will still be in the memory of the system even after you reboot it. If you don't save to flash and if you were to reboot the system, all your new configurations will be lost and you will have to reconfigure the system.

Do you want to save your configurations to flash? (y/n) [n] :
Chapter 3 - Additional Features

CLI Method
To configure certain parameters for a specific serial port:

**Step 1:** At the command prompt, type in the appropriate command to configure desired parameters.

To activate the serial port. `<string>` should be `ttyS<serial port number>`:

```
config configure line <serial port number> tty <string>
```

To configure admin_users:

```
config configure line <serial port number> adminusers <string>
```

To configure sniff_mode:

```
config configure line <serial port number> sniffmode <string>
```

To configure escape_char:

```
config configure line <serial port number> escape <string>
```

To configure multiple_sessions:

```
config configure line <serial port number> multiplesess <string>
```

**Tip.** You can configure all the parameters for a serial port in one line.

```
config configure line <serial port number> tty <string>
adminusers <string> sniffmode <string> escape <string> multiplesess <string>
```

**Step 2:** Activate and Save.

To activate your new configurations and save them to flash, type:

```
config write
```
Chapter 3 - Additional Features

SNMP

Short for Simple Network Management Protocol: a set of protocols for managing complex networks. The first versions of SNMP were developed in the early 80s. SNMP works by sending messages, called protocol data units (PDUs), to different parts of a network. SNMP-compliant devices, called agents, store data about themselves in Management Information Bases (MIBs) and return this data to the SNMP requesters.

The ACS uses the net-snmp package (http://www.net-snmp.org).

The net-snmp supports snmp version 1, 2 and 3. You can configure the /etc/snmp/snmpd.conf file as indicated later in this section.

1. Snmp version 1
   - RFC1155 - SMI for the official MIB tree
   - RFC1213 - MIB-II

2. Snmp version 2
   - RFC2578 - Structure of Management Information Version 2 (SMIv2)
   - RFC2579 - Textual Conventions for SMIv2
   - RFC2580 - Conformance Statements for SMIv2

3. Snmp version 3
   - RFC2570 - Introduction to Version 3 of the Internet-standard Network Management Framework
   - RFC2571 - An Architecture for Describing SNMP Management Frameworks
   - RFC2572 - Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)
   - RFC2573 - SNMP Applications
   - RFC2574 - User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)
Chapter 3 - Additional Features

- RFC2575 - View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)
- RFC2576 - Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework

4. Private UCD SNMP mib extensions (enterprises.2021)
   - Information about memory utilization (/proc/meminfo)
   - Information about system status (vmstat)
   - Information about net-snmp packet

5. Private Cyclades Vendor MIB (enterprises.2925)
   - Cyclades ACSxx Remote Management Object Tree (cyclades.4). This MIB permits you to get informations about the product, to read/write some configuration items and to do some administration commands. (For more details see the cyclades.mib file.)

Configuration for CAS, TS, and Dial-in Access

**vi Method**

Files to be changed:

/etc/snmp/snmpd.conf

This file has information about configuring for SNMP.

Browser Method

To configure SNMP with your browser:

**Step 1:** Point your browser to the ACS.
   In the address or location field of your browser type:

   <Console Access Server’s IP address>

**Step 2:** Log in as root and type the Web root password configured by the Web server.
   This will take you to the Configuration and Administration page.
Chapter 3 - Additional Features

Step 3: Click on the SNMP link.
Select the SNMP link. The SNMP configuration file will appear in text mode.

Step 4: Edit the configuration file and click on the Submit button

Step 5: Make changes effective.
Click on the Administration > Run Configuration link. Check the SNMP box and click on the Activate Configuration button.

Step 6: Click on the Administration > Load/Save Configuration and click on the Save to Flash button.
This will save the file in the flash.

Syslog

The syslog-ng daemon provides a modern treatment to system messages. Its basic function is to read and log messages to the system console, log files, other machines (remote syslog servers) and/or users as specified by its configuration file. In addition, syslog-ng is able to filter messages based on their content and to perform an action (e.g. to send an e-mail or pager message). In order to access these functions, the syslog-ng.conf file needs some specific configuration.

The configuration file (default: syslog-ng.conf) is read at startup and is reread after reception of a hangup (HUP) signal. When reloading the configuration file, all destination files are closed and reopened as appropriate. The syslog-ng reads from sources (files, TCP/UDP connections, syslogd clients), filters the messages and takes an action (writes in files, sends snmptrap, pager, e-mail or syslogs to remote servers).

There are five tasks required for configuring syslog-ng:

Task 1: Define Global Options.
Task 2: Define Sources.
Task 3: Define Filters.
Task 4: Define Actions (Destinations).
Task 5: Connect all of the above.
Chapter 3 - Additional Features

The five tasks are explained in the following section “Syslog-ng and its Configuration” on page 239.

Port Slave Parameters Involved with syslog-ng

conf.facility  This value (0-7) is the Local facility sent to the syslog-ng from PortSlave.

conf.DB_facility  This value (0-7) is the Local facility sent to the syslog-ng with data when syslog_buffering and/or alarm is active. When nonzero, the contents of the data buffer are sent to the syslogng every time a quantity of data equal to this parameter is collected. The syslog level for data buffering is hard coded to level five (notice) and facility local[0+conf.DB_facility]. The file /etc/syslog-ng/syslog-ng.conf should be set accordingly for the syslog-ng to take some action. Example value: 0.

all.syslog_buffering  When nonzero, the contents of the data buffer are sent to the syslog-ng every time a quantity of data equal to this parameter is collected. The syslog message is sent to syslog-ng with NOTICE level and LOCAL[0+conf.DB_facility] facility.

Configuration for CAS, TS, and Dial-in Access

vi Method

To change the PortSlave parameters: edit the /etc/portslave/pslave.conf file.

To change the syslog-ng configuration: edit the /etc/syslog-ng/syslog-ng.conf file.

Browser Method

To configure the PortSlave parameters, see the Data Buffering section. To configure syslog via your Web browser:

Step 1: **Point your browser to the ACS.**
In the address or location field of your browser type:

<Console Access Server’s IP address>

Step 2: **Log in as root and type the Web root password configured by the Web server.**
This will take you to the Configuration and Administration page.
Chapter 3 - Additional Features

Step 3: Click Syslog on the Configuration section.

Select the Syslog link. The following page will appear, giving information for configuring syslog:

![Syslog page 1](image)

Figure 31: Syslog page 1

Step 4: Edit the configuration file and click on the Submit button

Step 5: Make changes effective.

Click on the Administration > Run Configuration link. Check the Syslog-ng box and click on the Activate Configuration button.

Step 6: Click on the Administration > Load/Save Configuration and click on the Save to Flash button.

This will save the file in the flash.

Wizard Method

Step 1: Bring up the wizard.

At the command prompt, type the following to bring up the PortSlave parameters involved with the Syslog custom wizard:

```
  wiz --sl
```
Chapter 3 - Additional Features

Screen 1 will appear.

Screen 1:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system and press ENTER. Enter '#' if you want to deactivate that parameter or
2) Press ENTER if you are satisfied with the value within the brackets [ ] and want to go on to the next parameter or
3) Press ESC if you want to exit.

NOTE: For some parameters, if there is nothing within the brackets, it will continue to ask for a value. In that case, you must enter a valid value or # if you do not wish to configure the value.

Press ENTER to continue...

Screen 2:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

Current configuration:
(The ones with the '#' means it's not activated.)

conf.DB_facility : 0

Set to defaults? (y/n) [n] :
Chapter 3 - Additional Features

Screen 3:

***********************************************************
******** CONFIGURATION WIZARD ********
***********************************************************

CONF.FACILITY - This value (0-7) is the Local facility sent to the syslog. The file /etc/syslog-ng/syslog-ng.conf contains a mapping between the facility number and the action.

(Please see the 'Syslog-ng Configuration to use with Syslog Buffering Feature' section under Generating Alarms in Chapter 3 the system's manual for the syslog-ng configuration file.)

conf.facility[7] :

CONF.DB_FACILITY - This value (0-7) is the Local facility sent to the syslog with the data when syslog_buffering is active. The file /etc/syslog-ng/syslog-ng.conf contains a mapping between the facility number and the action.

(Please see the 'Syslog-ng Configuration to use with Syslog Buffering Feature' section under Generating Alarms in Chapter 3 the system's manual for the syslog-ng configuration file.)

conf.DB_facility[0] :

Note: all.syslog_buffering is configured under the wiz --db.
Chapter 3 - Additional Features

Screen 4:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

Current configuration:
(The ones with the '#' means it's not activated.)

conf.facility : 7(7)
conf.DB_facility : 0

Are these configuration(s) all correct? (y/n) [n] :

If you type 'n'
Type 'c' to go back and CORRECT these parameters
or 'q' to QUIT :
Typing 'c' repeats the application, typing 'q' exits the entire wiz application

If you type 'y' it leads to Screen 5.

Screen 5:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

(Note: If you are NOT connected to this unit through a
console, and you have just reconfigured the IP of this
unit, activating the new configurations may cause you to
lose connection. In that case, please reconnect to the
unit by the new IP address, and manually issue a saveconf
to save your configurations to flash.)

Do you want to activate your configurations now? (y/n) [y] :
Chapter 3 - Additional Features

Screen 6:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

Flash refers to a type of memory that can be erased and reprogrammed in units of memory known as blocks rather than one byte at a time; thus, making updating to memory easier.

If you choose to save to flash, your configurations thus far will still be in the memory of the system even after you reboot it. If you don't save to flash and if you were to reboot the system, all your new configurations will be lost and you will have to reconfigure the system.

Do you want to save your configurations to flash? (y/n) [n] :

CLI Method
To configure certain parameters for a specific serial port:

Step 1: At the command prompt, type in the appropriate command to configure desired parameters.
To activate the serial port. <string> should be ttyS<serial port number>:

config configure line <serial port number> tty <string>

To configure conf.facility:

config configure conf facility <number>

To configure DB_facility:

config configure conf dbfacility <number>
Step 2: Activate and Save.
To activate your new configurations and save them to flash, type:

```
config write
```

(This is essentially typing `signal_ras hup` and `saveconf` from the normal terminal prompt.)

The Syslog Functions
This section shows the characteristics of the syslog-ng that is implemented for all members of the AlterPath Console Server family. It is divided into three parts:

1. **Syslog-ng and its Configuration**
2. **Syslog-ng Configuration to use with Syslog Buffering Feature**
3. **Syslog-ng Configuration to use with Multiple Remote Syslog Servers**

Syslog-ng and its Configuration
The five tasks previously mentioned are detailed below.

**Task 1: Specify Global Options.**
You can specify several global options to syslog-ng in the options statement:

```
options { opt1(params); opt2(params); ... };
```

where `optn` can be any of the following:
## Chapter 3 - Additional Features

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_reopen(n)</td>
<td>The time to wait before a dead connection is reestablished.</td>
</tr>
<tr>
<td>time_reap(n)</td>
<td>The time to wait before an idle destination file is closed.</td>
</tr>
<tr>
<td>sync_freq(n)</td>
<td>The number of lines buffered before written to file. (The file is synced when this number of messages has been written to it.)</td>
</tr>
<tr>
<td>mark_freq(n)</td>
<td>The number of seconds between two MARKS lines.</td>
</tr>
<tr>
<td>log_fifo_size(n)</td>
<td>The number of lines fitting to the output queue.</td>
</tr>
<tr>
<td>chain_hostname</td>
<td>Enable/disable the chained hostname format.</td>
</tr>
<tr>
<td></td>
<td>(yes/no) or long_hostname (yes/no)</td>
</tr>
<tr>
<td>use_time_recd</td>
<td>Use the time a message is received instead of the one specified in the message.</td>
</tr>
<tr>
<td>(yes/no)</td>
<td></td>
</tr>
<tr>
<td>use_dns (yes/no)</td>
<td>Enable or disable DNS usage. syslog-ng blocks on DNS queries, so enabling DNS may lead to a Denial of Service attach.</td>
</tr>
<tr>
<td>gc_idle_threshold(n)</td>
<td>Sets the threshold value for the garbage collector, when syslog-ng is idle. GC phase starts when the number of allocated objects reach this number. Default: 100.</td>
</tr>
<tr>
<td>gc_busy_threshold(n)</td>
<td>Sets the threshold value for the garbage collector. When syslog-ng is busy, GC phase starts.</td>
</tr>
<tr>
<td>create_dirs(yes/no)</td>
<td>Enable the creation of new directories.</td>
</tr>
<tr>
<td>owner(name)</td>
<td>Set the owner of the created file to the one specified. Default: root.</td>
</tr>
<tr>
<td>group(name)</td>
<td>Set the group of the created file to the one specified. Default: root.</td>
</tr>
<tr>
<td>perm(mask)</td>
<td>Set the permission mask of the created file to the one specified. Default: 0600.</td>
</tr>
</tbody>
</table>
Chapter 3 - Additional Features

Task 2: Define sources.
To define sources use this statement:

\[
\text{source <identifier>} \{ \text{source-driver([params])}; \text{source-driver([params])}; ... \};
\]

where:

- **identifier**: Has to uniquely identify this given source.
- **source-driver**: Is a method of getting a given message.
- **params**: Each source-driver may take parameters. Some of them are required, some of them are optional.

The following source-drivers are available:

a) **internal()**: Messages are generated internally in syslog-ng.

b) **unix-stream (filename [options])**

They open the given AF_UNIX socket, and start listening for messages.

Options: owner(name), group(name), perm(mask) are equal global options

and

**unix-dgram (filename [options])**

*keep-alive(yes/no)* - Selects whether to keep connections opened when syslog-ng is restarted. Can be used only with unix_stream. Default: yes

*max-connections(n)* - Limits the number of simultaneously opened connections. Can be used only with unix_stream. Default: 10.
Chapter 3 - Additional Features

c) tcp([options])

These drivers let you receive messages from the network, and as the name of the drivers show, you can use both TCP and UDP.
and
udp([options])

None of tcp() and udp() drivers require positional parameters. By default they bind to 0.0.0.0:514, which means that syslog-ng will listen on all available interfaces.

Options:
ip(<ip address>) - The IP address to bind to. Default: 0.0.0.0.
port(<number>) - UDP/TCP port used to listen messages. Default: 514.
max-connections(n) - Limits the number of simultaneously opened connections. Default: 10.

d) file(filename)

Opens the specified file and reads messages.

e) pipe(filename)

Opens a named pipe with the specified name, and listens for messages. (You'll need to create the pipe using mkfifo command).

Some Examples of Defining Sources

1) To read from a file:

source <identifier> {file(filename);};

Example to read messages from “/temp/file1” file:

source file1 {file(’/temp/file1’);};

Example to receive messages from the kernel:

source s_kernel { file(’/proc/kmsg’); }; 

2) To receive messages from local syslogd clients:

source sysl {unix-stream(’/dev/log’);};

3) To receive messages from remote syslogd clients:

source s_udp { udp(ip(<cliente ip>) port(<udp port>)); }; 

Example to listen to messages from all machines on UDP port 514:

source s_udp { udp(ip(0.0.0.0) port(514)); };
Chapter 3 - Additional Features

Example to listen to messages from one client (IP address=10.0.0.1) on UDP port 999:

```plaintext
source s_udp_10 { udp(ip(10.0.0.1) port(999)); };
```

**Task 3: Define filters.**

To define filters use this statement:

```plaintext
filter <identifier> { expression; };
```

where:

- **identifier** Has to uniquely identify this given filter.
- **expression** Boolean expression using internal functions, which has to evaluate to true for the message to pass.

The following internal functions are available:

a) **facility(<facility code>)** Selects messages based on their facility code.

b) **level(<level code>) or priority(<level code>)** Selects messages based on their priority.

c) **program(<string>)** Tries to match the <string> to the program name field of the log message.

d) **host(<string>)** Tries to match the <string> to the hostname field of the log message.

e) **match(<string>)** Tries to match the <string> to the message itself.

Some Examples of Defining Filters

1) To filter by facility:

```plaintext
filter f_facility { facility(<facility name>); };
```
Chapter 3 - Additional Features

Examples:

filter f_daemon { facility(daemon); };
filter f_kern { facility(kern); };
filter f_debug { not facility(auth, authpriv, news, mail); };

2) To filter by level:

filter f_level { level(<level name>); };

Examples:

filter f_messages { level(info .. warn); };
filter f_emergency { level(emerg); };
filter f_alert { level(alert); };

3) To filter by matching one string in the received message:

filter f_match { match('string'); };

Example to filter by matching the string "named":

filter f_named { match('named'); };

4) To filter ALARM messages (note that the following three examples should be one line):

filter f_alarm { facility(local[0+<conf.DB_facility>]) and level(info) and match('ALARM') and match('your string'); };

Example to filter ALARM message with the string “kernel panic”:

filter f_kpanic { facility(local[0+<conf.DB_facility>]) and level(info) and match('ALARM') and match('kernel panic'); };

Example to filter ALARM message with the string “root login”:

filter f_root { facility(local[0+<conf.DB_facility>]) and level(info) and match('ALARM') and match('root login'); };

244 AlterPath Console Server
5) To eliminate sshd debug messages:

\[
\text{filter f\_sshd\_debug} \{ \text{not program('sshd')} \text{ or not level(debug); } \};
\]

6) To filter the syslog\_buffering:

\[
\text{filter f\_syslog\_buf} \{ \text{facility(local[0+<conf.DB\_facility>]) and level(notice); } \};
\]

**Task 4: Define Actions.**

To define actions use this statement (note that the statement should be one line):

\[
\text{destination <identifier> \{ destination-driver([params]); destination-driver([param]); ..; }}
\]

where:

- **identifier**
  - Has to uniquely identify this given destination.

- **destination driver**
  - Is a method of outputting a given message.

- **params**
  - Each destination-driver may take parameters. Some of them required, some of them are optional.

The following destination drivers are available:

a) **file(filename [options])**

This is one of the most important destination drivers in syslog-ng. It allows you to output log messages to the named file. The destination filename may include macros (by prefixing the macro name with a '$' sign) which gets expanded when the message is written. Since the state of each created file must be tracked by syslog-ng, it consumes some memory for each file. If no new messages are written to a file within 60 seconds (controlled by the time\_reap global option), it's closed, and its state is freed.
Chapter 3 - Additional Features

Available macros in filename expansion:
HOST - The name of the source host where the message originated from.
FACILITY - The name of the facility the message is tagged as coming from.
PRIORITY or LEVEL - The priority of the message.
PROGRAM - The name of the program the message was sent by.
YEAR, MONTH, DAY, HOUR, MIN, SEC - The year, month, day, hour, min, sec of the message was sent.
TAG - Equals FACILITY/LEVEL.
FULLHOST - The name of the source host and the source-driver:
<source-driver>@<hostname>
MSG or MESSAGE - The message received.
FULLDATE - The date of the message was sent.

Available options:
log_fifo_size(number) - The number of entries in the output file.
sync_freq(number) - The file is synced when this number of messages has been written to it.
owner(name), group(name), perm(mask) - Equals global options.
template("string") - Syslog-ng writes the “string” in the file. You can use the MACROS in the string.
encrypt(yes/no) - Encrypts the resulting file.
compress(yes/no) - Compresses the resulting file using zlib.

b) pipe(filename [options])
This driver sends messages to a named pipe. Available options:
owner(name), group(name), perm(mask) - Equals global options.
template("string") - Syslog-ng writes the “string” in the file. You can use the MACROS in the string.

b) unix-stream(filename) and unix-dgram(filename)
This driver sends messages to a UNIX socket in either SOCKET_STREAM or SOCK_DGRAM mode.

c) udp("<ip address>" port(number);) and tcp("<ip address>" port(number);)
This driver sends messages to another host (ip address/port) using either UDP or TCP protocol.

e) usertext(<username>)
This driver writes messages to the terminal of a logged-in username.
Chapter 3 - Additional Features

Some Examples of Defining Actions

1) To send e-mail:

```plaintext
destination <ident> { pipe('/dev/cyc_alarm' template('sendmail <pars>'));};
```

where ident: uniquely identifies this destination. Parameters:

- `-t <name>[,<name>]` To address
- `[c <name>[,<name>]]` CC address
- `[b <name>[,<name>]]` Bcc address
- `[r <name>[,<name>]]` Reply-to address
- `-f <name>` From address
- `-s "<text>"` Subject
- `-m "<text message>"` Message
- `-h <IP address or name>` SMTP server
- `[-p <port>]` Port used. default:25

To mount the message, use this macro:

- `$FULLDATE` The complete date when the message was sent.
- `$FACILITY` The facility of the message.
- `$PRIORITY` or `$LEVEL` The priority of the message.
- `$PROGRAM` The message was sent by this program (BUFFERING or SOCK).
Chapter 3 - Additional Features
$HOST

The name of the source host.

$FULLHOST

The name of the source host and the source driver. Format:
<source>@<hostname>

$MSG or $MESSAGE

The message received.

Example to send e-mail to z@none.com (SMTP's IP address 10.0.0.2) from the e-mail address
a@none.com with subject “ ACS-ALARM”. The message will carry the current date, the hostname of this ACS and the message that was received from the source.
destination d_mail1 {
pipe('/dev/cyc_alarm'
template('sendmail -t z@none.com -f a@none.com -s \'ACS-ALARM\' \
-m \'$FULLDATE $HOST $MSG\' -h 10.0.0.2'));
};

2) To send to pager server (sms server):
destination <ident> {pipe(‘/dev/cyc_alarm’ template(‘sendsms
<pars>’));};
where ident: uniquely identify this destination
pars: -d <mobile phone number>
-m \’<message - max.size 160 characters>\’
-u <username to login on sms server>
-p <port sms - default : 6701>
<server IP address or name>
Example to send a pager to phone number 123 (Pager server at 10.0.0.1) with message carrying the current date, the hostname of this ACS and the message that was received from the
source:
destination d_pager {

248

AlterPath Console Server


Chapter 3 - Additional Features

```bash
pipe('/dev/cyc_alarm'
template('sendsms -d 123 -m \'FULLDATE $HOST $MSG\' 10.0.0.1'));
}

3) To send snmptrap:

destination <ident> {pipe('/dev/cyc_alarm' template('snmptrap <pars>')); }

where ident : uniquely identify this destination
pars : -v 1

<snmptrapd IP address>
-c public : community
"" : enterprise-oid
"" : agent/hostname
<trap number> : 2-Link Down, 3-Link Up, 4-Authentication Failure
0 : specific trap
"" : host-uptime
1.3.6.1.2.1.2.1.2.1.2.1 :interfaces.iftable.ifentry.ifdescr.1
s : the type of the next field (it is a string)
"<message - max. size 250 characters>"

Example to send a Link Down trap to server at 10.0.0.1 with message carrying the current date, the hostname of this ACS and the message that was received from the source:

destination d_trap {
pipe("/dev/cyc_alarm"

template("snmptrap -v 1 -c public 10.0.0.1 \"\" \"\" 2 0 \"\" \".1.3.6.1.2.1.2.1.2.1.2.1 s \"FULLDATE $HOST $MSG\"");
```
Chapter 3 - Additional Features

4) To write in file:

destination d_file { file(<filename>);};

Example send message to console:

destination d_console { file("/dev/ttyS0");};

Example to write a message in /var/log/messages file:

destination d_message { file("/var/log/messages"); }; 

5) To write messages to the session of a logged-in user:

destination d_user { usertty("<username>" ); }; 

Example to send message to all sessions with root user logged:

destination d_userroot { usertty("root" ); }; 

6) To send a message to a remote syslogd server:

destination d_udp { udp("<remote IP address>" port(514)); }; 

Example to send syslogs to syslogd located at 10.0.0.1:

destination d_udpl { udp("10.0.0.1" port(514)); }; 

Task 5: Connect all of the above.
To connect the sources, filters, and actions, use the following statement. (Actions would be any message coming from one of the listed sources. A match for each of the filters is sent to the listed destinations.)

log { source(S1); source(S2); ... 
filter(F1);filter(F2);...
destination(D1); destination(D2);... 
};
Chapter 3 - Additional Features

where:

Sk  Identifier of the sources defined before.
Fx  Identifier of the filters defined before.
Dx  Identifier of the actions/destinations defined before.

Examples:
1) To send all messages received from local syslog clients to console:

\[ \text{log} \left( \text{source(sysl)}; \text{destination(d\_console)}; \right); \]

2) To send only messages with level alert and received from local syslog clients to all logged root user:

\[ \text{log} \left( \text{source(sysl)}; \text{filter(f\_alert)}; \text{destination(d\_userroot)}; \right); \]

3) To write all messages with levels info, notice, or warning and received from syslog clients (local and remote) to /var/log/messages file:

\[ \text{log} \left( \text{source(sysl)}; \text{source(s\_udp)}; \text{filter(f\_messages)}; \text{destination(d\_messages)}; \right); \]

4) To send e-mail if message received from local syslog client has the string “kernel panic”:

\[ \text{log} \left( \text{source(sysl)}; \text{filter(f\_kpanic)}; \text{destination(d\_mail1)}; \right); \]

5) To send e-mail and pager if message received from local syslog client has the string “root login”:

\[ \text{log} \left( \text{source(sysl)}; \text{filter(f\_root)}; \text{destination(d\_mail1)}; \text{destination(d\_pager)}; \right); \]

6) To send messages with facility kernel and received from syslog clients (local and remote) to remote syslogd:

\[ \text{log} \left( \text{source(sysl)}; \text{source(s\_udp)}; \text{filter(f\_kern)}; \text{destination(d\_udp1)}; \right); \]
Syslog-ng Configuration to use with Syslog Buffering Feature
This configuration example uses the syslog buffering feature, and sends messages to the remote syslogd (10.0.0.1).

**Step 1: Configure pslave.conf parameters.**
In the pslave.conf file the parameters of the syslog buffering feature are configured as:

```
conf.DB_facility 1
all.syslog_buffering 100
```

**Step 2: Add lines to syslog-ng.conf.**
Add the following lines by vi or browser to the file:

```
# local syslog clients
source src { unix-stream("/dev/log"); };
destination d_buffering { udp("10.0.0.1"); };
filter f_buffering { facility(local1) and level(notice); };
# send only syslog_buffering messages to remote server
log { source(src); filter(f_buffering); destination(d_buffering); };
```
Chapter 3 - Additional Features

Syslog-ng Configuration to use with Multiple Remote Syslog Servers
This configuration example is used with multiple remote syslog servers.

Step 1: Configure pslave.conf parameters.
In the pslave.conf file the facility parameter is configured as:

    conf.facility 1

Step 2: Add lines to syslog-ng.conf.
The syslog-ng.conf file needs these lines:

    # local syslog clients
    source src { unix-stream("/dev/log"); }
    # remote server 1 - IP address 10.0.0.1 port default
    destination d_udp1 { udp("10.0.0.1"); }
    # remote server 2 - IP address 10.0.0.2 port 1999
    destination d_udp2 { udp("10.0.0.2\ 1999"); }
    # filter messages from facility local1 and level info to warning
    filter f_local1 { facility(local1) and level(info..warn); }
    # filter messages from facility local 1 and level err to alert
    filter f_critic { facility(local1) and level(err .. alert); }
    # send info, notice and warning messages to remote server udp1
    log { source(src); filter(f_local1); destination(d_udp1); }
    # send error, critical and alert messages to remote server udp2
    log { source(src); filter(f_critic); destination(d_udp2); }
You can change the format of the login prompt and banner that is issued when a connection is made to the system. Prompt and banner appearance can be port-specific as well.

**Parameters Involved and Passed Values**

Terminal Appearance involves the following parameters:

- **all.prompt**
  This text defines the format of the login prompt. Expansion characters can be used here. Example value: `%h login:

- **all.issue**
  This text determines the format of the login banner that is issued when a connection is made to the AlterPath Console Server. \
  represents a new line and \r represents a carriage return. Expansion characters can be used here. Value for this Example:
  \
  \r\n
  Welcome to terminal server %h port S%p \n\r

- **all.lf_suppress**
  This activates line feed suppression. When configured as 0, line feed suppression will not be performed. When 1, extra line feed will be suppressed.

- **all.auto_answer_input**
  This parameter is used in conjunction with the next parameter, auto_answer_output. If configured and if there is no session established to the port, this parameter will constantly be compared and matched up to the string of bytes coming in remotely from the server. If a match is found, the string configured in auto_answer_output is sent back to the server. To represent the ESC character as part of this string, use the control character, ^[.
Configuration for CAS, TS, and Dial-in Access

Browser Method

Step 1: Point your browser to the ACS.
In the address or location field of your browser type:

<Console Access Server’s IP address>

Step 2: Log in as root and type the Web root password configured by the Web server.
This will take you to the Configuration and Administration page.

Step 3: Select the Serial Ports link.
Click on the Serial Ports link on the Link Panel to the left of the page or in the Configuration section of the page. This will take you to the Port Selection page.

Step 4: Select port(s).
On the Port Selection page, choose all ports or an individual port to configure, from the dropdown menu. Click the Submit button. This will take you to the Serial Port Configuration page.

Step 5: Scroll down to the Terminal Server section.
You can change the settings for Banner Field (issue) and Login Prompt field here.

Step 6: Click on the Submit button.

Step 7: Make the changes effective.
Click on the Administration > Run Configuration link, check the Serial Ports/ Ethernet/Static Routes box and click on the Activate Configuration button.

Step 8: Click on the link Administration > Load/Save Configuration.
Chapter 3 - Additional Features

Step 9: Click the Save Configuration to Flash button.
       The configuration was saved in flash.

Wizard Method

Step 1: Bring up the wizard.
       At the command prompt, type the following to bring up the Terminal Appearance
       custom wizard:

       wiz --tl

       Screen 1 will appear.

Screen 1:

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

INSTRUCTIONS for using the Wizard:
You can:
1) Enter the appropriate information for your system
   and press ENTER. Enter '#' if you want to
deactivate that parameter or
2) Press ENTER if you are satisfied with the value
   within the brackets [ ] and want to go on to the
   next parameter or
3) Press ESC if you want to exit.

NOTE: For some parameters, if there is nothing within
the brackets, it will continue to ask for a value.
In that case, you must enter a valid value or # if you
do not wish to configure the value.

Press ENTER to continue...
Chapter 3 - Additional Features

Screen 2:

***********************************************************
********* CONFIGURATION WIZARD ***********
***********************************************************
Current configuration:
(The ones with the '#' means it's not activated.)

all.issue : \r\n\r\nWelcome to terminal server %h port $p \n\r\n\r\n
all.prompt : %h login:
all.lf_suppress : 0
all.auto_answer_input : #
all.auto_answer_output : #

Set to defaults? (y/n) [n] :

Screen 3:

***********************************************************
********* CONFIGURATION WIZARD ***********
***********************************************************
ALL.ISSUE - This text determines the format of the login banner that is issued when a connection is made to the system. \n represents a new line and \r respresents a carriage return.

all.issue[\r\n\r\nWelcome to terminal server %h port $p \n\r\n]

ALL.PROMPT - This text defines the format of the login prompt.

all.prompt[%h login:] :

Chapter 3 - Additional Features

Screen 4:
***********************************************************
********* CONFIGURATION WIZARD *********
***********************************************************
ALL.LF_SUPPRESS - This activates line feed suppression.
When configured as 0, line feed suppression will not be
performed. When 1, extra line feed will be suppressed.

all.lf_suppress[0] :

ALL.AUTO_ANSWER_INPUT - This parameter is used in conjunc-
tion with the next parameter, auto_answer_output. Please
refer to the manual for more info.

If configured and if there is no session established to
the port, this parameter will constantly be compared and
matched up to the string of bytes coming in remotely from
the server. If a match is found, the string configured in
auto_answer_output is sent back to the server. To repre-
sent the ESC character as part of this string, use the
control character, ^[.

all.auto_answer_input[#] :

Screen 5:
***********************************************************
********* CONFIGURATION WIZARD *********
***********************************************************
ALL.AUTO_ANSWER_OUTPUT - This parameter is used in conjunc-
tion with the previous parameter, auto_answer_input. Please
refer to the manual for more info.
If configured, and if there is no session established to
the port, this parameter is sent back to the server
when there is a match between the incoming data and
auto_answer_input. To represent the ESC character as part
of this string, use the control character, ^[.
Chapter 3 - Additional Features

all.auto_answer_output[#] :

Screen 6:
***********************************************************
********* CONFIGURATION WIZARD *********
***********************************************************
Current configuration:
(The ones with the '"' means it's not activated.)

all.issue : \r\n\nWelcome to terminal server %h port S%p \n\r\n
all.prompt : %h login:
all.lf_suppress : 0
all.auto_answer_input : #
all.auto_answer_output : #

Are these configuration(s) all correct? (y/n) [n] :

If you type 'N'
Type 'c' to go back and CORRECT these parameters
or 'q' to QUIT :
Typing 'c' repeats the application, typing 'q' exits the entire wiz application

If you type 'Y'
Discard previous port-specific parameters? (y/n) [n] :

Note: Answering yes to this question will discard only the parameter(s) which you are currently configuring if they were configured for a specific port in a previous session. For instance, if you are currently configuring parameter, all.x, and there was a specific port, s2.x, configured; then, answering yes to this question will discard s2.x.

Type 'c' to CONTINUE to set these parameters for specific ports or 'q' to QUIT :

Typing 'c' leads to Screen 7, typing 'q' leads to Screen 8.
Chapter 3 - Additional Features

Screen 7:
***********************************************************
*********CONFIGURATION WIZARD ***********
***********************************************************

You have 8 available ports on this system.

Type 'q' to quit, a valid port number[1-8], or anything else to refresh:

Screen 8:
***********************************************************
*********CONFIGURATIONWIZARD ***********
***********************************************************

(Note: If you are NOT connected to this unit through a console, and you have just reconfigured the IP of this unit, activating the new configurations may cause you to lose connection. In that case, please reconnect to the unit by the new IP address, and manually issue a saveconf to save your configurations to flash.)

Do you want to activate your configurations now? (y/n) [y] :

Screen 9:
***********************************************************
*********CONFIGURATION WIZARD ***********
***********************************************************

Flash refers to a type of memory that can be erased and reprogrammed in units of memory known as blocks rather than one byte at a time; thus, making updating to memory easier.

If you choose to save to flash, your configurations thus
far will still be in the memory of the system even after you reboot it. If you don't save to flash and if you were to reboot the system, all your new configurations will be lost and you will have to reconfigure the system.

Do you want to save your configurations to flash? (y/n) [n] :

CLI Method
To configure certain parameters for a specific serial port:

Step 1: At the command prompt, type in the appropriate command to configure desired parameters.
To activate the serial port. <string> should be ttyS<serial port number>:

config configure line <serial port number> tty <string>

To configure issue:

config configure line <serial port number> issue <string>

To configure prompt:

config configure line <serial port number> prompt <string>

To configure lf Suppress:

config configure line <serial port number> lf <number>

To configure auto_answer_input:

config configure line <serial port number> auto_input <string>

To configure auto_answer_output:

config configure line <serial port number> auto_output <string>
Chapter 3 - Additional Features

Tip. You can configure all the parameters for a serial port in one line.

```bash
config configure line <serial port number> tty <string> issue <string> prompt <string> lf <number> auto_input <string> auto_output <string>
```

Step 2: Activate and Save.

To activate your new configurations and save them to flash, type:

```bash
config write
```

(This is essentially typing `signal_ras hup` and `saveconf` from the normal terminal prompt.)
Chapter 3 - Additional Features

Time Zone

The content of the file /etc/TIMEZONE can be in one of two formats. The first format is used when there is no daylight savings time in the local time zone:

\[ \text{std offset} \]

The `std` string specifies the name of the time zone and must be three or more alphabetic characters. The offset string immediately follows `std` and specifies the time value to be added to the local time to get Coordinated Universal Time (UTC). The offset is positive if the local time zone is west of the Prime Meridian and negative if it is east. The hour must be between 0 and 24, and the minutes and seconds must be between 0 and 59.

The second format is used when there is daylight savings time:

\[ \text{std offset dst [offset],[start[/time]],end[/time]} \]

There are no spaces in the specification. The initial `std` and `offset` specify the Standard Time zone, as described above. The `dst` string and `offset` specify the name and `offset` for the corresponding daylight savings time zone. If the `offset` is omitted, it defaults to one hour ahead of Standard Time.

The `start` field specifies when daylight savings time goes into effect and the `end` field specifies when the change is made back to Standard Time. These fields may have the following formats:

- `Jn` This specifies the Julian day, with `n` being between 1 and 365. February 29 is never counted even in leap years.
- `n` This specifies the Julian day, with `n` being between 1 and 365. February 29 is counted in leap years.
- `Mm.w.d` This specifies day, `d` (0 < `d` < 6) of week `w` (1 < `w` < 5) of month `m` (1 < `m` < 12). Week 1 is the first week in which day `d` occurs and week 5 is the last week in which day `d` occurs. Day 0 is a Sunday.

The time fields specify when, in the local time currently in effect, the change to the other time occurs. If omitted, the default is 02:00:00.
Chapter 3 - Additional Features

In the example below:

GST+7DST+6M4.1.0/14:30.M10.5.6/10

Daylight Savings Time starts on the first Sunday of April at 2:30 p.m. and it ends on the last Saturday of October at 10:00 a.m.

How to set Date and Time
The date command prints or sets the system date and time. Format of the command:

date [MMDDhhmm[[CC]YY]
^^^ year
^^^^ century
^^ minute
^^ hour
^ day
month

For example:

date 101014452002

produces:

Thu Oct 10 14:45:00 DST 2002

The DST is because it was specified in /etc/TIMEZONE.
Appendix A - New User Background Information

Users and Passwords

A username and password are necessary to log in to the AlterPath Console Server. The user root is predefined, with a password tslinux. A password should be configured as soon as possible to avoid unauthorized access. Type the command:

```
passwd
```

to create a password for the root user. To create a regular user (without root privileges), use the commands:

```
adduser user_name
passwd user_password
```

To log out, type “logout” at the command prompt.

Show who is logged in and what they are doing

The command "w" displays information about the users currently on the machine, and their processes. It calls two commands: w_ori and w_cas. The w_ori is the new name of the original command "w" and the w_cas shows the CAS sessions information.

The header of w_ori shows, in this order: the current time, how long the system has been running, how many users are currently logged on (excluded the CAS users), and the system load averages for the past 1, 5, and 15 minutes.

The following entries are displayed for each user (excluded the CAS users): login name, the tty name, the remote host, login time, idle time, JCPU time (it is the time used by all processes attached to the tty), PCPU time (it is the time used by the current process, named in the “what” field), and the command line of their current process.

The header of w_cas shows how many CAS users are currently logged on. The following entries are displayed for each CAS user: login name, the tty name, the remote host and remote port, login time, the process ID and the command line of the current process.
Appendix A - New User Background Information

Linux File Structure

The Linux file system is organized hierarchically, with the base (or root) directory represented by the symbol "/". All folders and files are nested within each other below this base directory. The directories located just below the base directory are:

/home  Contains the work directories of system users.
/bin   Contains applications and utilities used during system initialization.
/dev   Contains files for devices and ports.
/etc   Contains configuration files specific to the operating system.
/lib   Contains shared libraries.
/proc  Contains process information.
/mnt   Contains information about mounted disks.
/opt   Location where packages not supplied with the operating system are stored.
/tmp   Location where temporary files are stored.
/usr   Contains most of the operating system files.
/var   Contains operating system data files.
Appendix A - New User Background Information

Basic File Manipulation Commands

The basic file manipulation commands allow the user to copy, delete, and move files and create and delete directories.

**cp** file_name destination
- a) `cp text.txt /tmp` Copies the file indicated by file_name to the path indicated by destination. a) Copies the file text.txt in the current directory to the tmp directory.
- b) `cp /chap/robo.php ./excess.php` b) Copies the file robo.php in the chap directory to the current directory and renames the copy excess.php.

**rm** file_name  Removes the file indicated by file_name.

**mv** file_name destination  Moves the file indicated by file_name to the path indicated by destination.

**mkdir** directory_name
- a) `mkdir spot` a) creates the directory spot in the current directory.
- b) `mkdir /tmp/snuggles` b) creates the directory snuggles in the directory tmp.

**rmdir** directory_name  Removes the directory indicated by directory_name.

Other commands allow the user to change directories and see the contents of a directory.

**pwd** Supplies the name of the current directory. While logged in, the user is always “in” a directory. The default initial directory is the user's home directory: /home/<username>.

**ls** [options] directory_name  Lists the files and directories within directory_name. Some useful options are -l for more detailed output and -a which shows hidden system files.

**cd** directory_name  Changes the directory to the one specified.

**cat** file_name  Prints the contents of file_name to the screen.
Appendix A - New User Background Information

Shortcuts:

. (one dot) Represents the current directory.
.. (two dots) Represents one directory above the current directory (i.e. one directory closer to the base directory).

The vi Editor

To edit a file using the vi editor, type:

```
vi file_name
```

Vi is a three-state line editor: it has a command mode, a line mode and an editing mode. If in doubt as to which mode you are in, press the `<ESC>` key which will bring you to the command mode.

<table>
<thead>
<tr>
<th>Mode</th>
<th>What is done there</th>
<th>How to get there</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command mode</td>
<td>Navigation within the open file.</td>
<td>Press the <code>&lt;ESC&gt;</code> key.</td>
</tr>
<tr>
<td>Editing mode</td>
<td>Text editing.</td>
<td>See list of editing commands below.</td>
</tr>
<tr>
<td>Line mode</td>
<td>File saving, opening, etc. Exiting from vi.</td>
<td>From the command mode, type <code>:</code> (colon).</td>
</tr>
</tbody>
</table>

When you enter the vi program, you are automatically in command mode. To navigate to the part of the file you wish to edit, use the following keys:
Appendix A - New User Background Information

Table 15: vi navigation commands

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>h</td>
<td>Moves the cursor to the left (left arrow).</td>
</tr>
<tr>
<td>j</td>
<td>Moves the cursor to the next line (down arrow).</td>
</tr>
<tr>
<td>k</td>
<td>Moves the cursor to the previous line (up arrow).</td>
</tr>
<tr>
<td>l</td>
<td>Moves the cursor to the right (right arrow).</td>
</tr>
</tbody>
</table>

Having arrived at the location where text should be changed, use these commands to modify the text (note commands “i” and “o” will move you into edit mode and everything typed will be taken literally until you press the <ESC> key to return to the command mode).

Table 16: vi file modification commands

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>Inserts text before the cursor position (everything to the right of the cursor is shifted right).</td>
</tr>
<tr>
<td>o</td>
<td>Creates a new line below the current line and insert text (all lines are shifted down).</td>
</tr>
<tr>
<td>dd</td>
<td>Removes the entire current line.</td>
</tr>
<tr>
<td>x</td>
<td>Deletes the letter at the cursor position.</td>
</tr>
</tbody>
</table>

After you have finished modifying a file, enter line mode (by typing “:” from command mode) and use one of the following commands:

Table 17: vi line mode commands

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>w</td>
<td>Saves the file (w is for write).</td>
</tr>
<tr>
<td>wq</td>
<td>Saves and closes the file (q is for quit).</td>
</tr>
<tr>
<td>q!</td>
<td>Closes the file without saving.</td>
</tr>
<tr>
<td>w file</td>
<td>Saves the file with the name &lt;file&gt;.</td>
</tr>
<tr>
<td>e file</td>
<td>Opens the file named &lt;file&gt;.</td>
</tr>
</tbody>
</table>
Appendix A - New User Background Information

The Routing Table

The AlterPath Console Server has a static routing table that can be seen using the commands:

\texttt{route}

or

\texttt{netstat \textasciitilde rn}

The file /etc/network/st_routes is the AlterPath Console Server's method for configuring static routes. Routes should be added to the file (which is a script run when the AlterPath Console Server is initialized) or at the prompt (for temporary routes) using the following syntax:

\texttt{route [add|del] [-net|-host] target netmask nt_msk [gw gt\_way] interf}

- \texttt{[add|del]} One of these tags must be present. Routes can be either added or deleted.
- \texttt{[-net|-host]} Net is for routes to a network and -host is for routes to a single host.
- \texttt{target} Target is the IP address of the destination host or network.
- \texttt{netmask} The tag netmask and nt\_mask are necessary only when subnetting is used, otherwise, a mask appropriate to the target is assumed. nt\_mask must be specified in dot notation.
- \texttt{nt\_msk} Specifies a gateway, when applicable. gt\_way is the IP address or hostname of the gateway.
- \texttt{gw gt\_way} The interface to use for this route. Must be specified if a gateway is not. When a gateway is specified, the operating system determines which interface is to be used.
Secure Shell Session

Ssh is a command interface and protocol often used by network administrators to connect securely to a remote computer. Ssh replaces its non-secure counterpart rsh and rlogin. There are two versions of the protocol, ssh and ssh2. The AlterPath Console Server offers both. The command to start an ssh client session from a UNIX workstation is:

```
ssh -t <user>@<hostname>
```

where

```
<user> = <username>:ttySnn or
  <username>:socket_port or
  <username>:ip_addr or
  <username>:serverfarm
```

Note: “serverfarm” is a physical port alias. It can be configured in the file pslave.conf. An example:

```
username: cyclades
ACS16 IP address: 192.168.160.1
host name: acs16
servername for port 1: file_server
```

ttyS1 is addressed by IP 10.0.0.1 or socket port 7001. The various ways to access the server connected to the port are:

```
ssh -t cyclades:ttyS1@acs16
ssh -t cyclades:7001@acs16
ssh -t cyclades:10.0.0.1@acs16
ssh -t cyclades:file_server@acs16
```
Appendix A - New User Background Information

ssh -t -l cyclades:10.0.0.1acs16
ssh -t -l cyclades:7001 acs16

For openssh clients, version 3.1p1 or later ssh2 is the default. In that case, the -1 flag is used for ssh1.

ssh -t cyclades:7001@acs16
(openssh earlier than 3.1p1 - Cyclades-TS V_1.3.1 and earlier -> ssh1 will be used)

ssh -t -2 cyclades:7001@acs16
(openssh earlier than 3.1p1 - Cyclades-TS V_1.3.1 and earlier -> ssh2 will be used)

ssh -t cyclades:7001@acs16
(openssh 3.1p1 or later - Cyclades-TS V_1.3.2 or later/AlterPath Console Server version 2.1.0 or later -> ssh2 will be used)

ssh -t -1 cyclades:7001@acs16
(openssh 3.1p1 or later - Cyclades-TS V_1.3.2 or later/AlterPath Console Server version 2.1.0 or later -> ssh1 will be used)

To log in to a port that does not require authentication, the username is not necessary:

ssh -t :ttyS1@acs16
Note: In this case, the file sshd_config must be changed in the following way:
PermitRootLogin Yes
PermitEmptyPassword Yes
Appendix A - New User Background Information

Configuring sshd's client authentication using SSH Protocol version 1

**Step 1: Only RhostsAuthentication yes in sshd_config.**

In the linux host enable in the file /etc/ssh/ssh_config the parameters:

```
Host *
    RhostsAuthentication yes
    UsePrivilegedPort yes
```

- **One of these:**
  - hostname or ipaddress in /etc/hosts.equiv or /etc/ssh/shosts.equiv
  - hostname or ipaddress and username in ~/.rhosts or ~/.shosts and IgnoreRhosts no in sshd_config

- **Client start-up command: ssh -t <ACS_ip or Serial_port_ip> (if the ssh client is running under a session belonging to a username present both in the workstation's database and the ACS's database).**

- **Client start-up command: ssh -t -l <username> <ACS_ip or Serial_port_ip> (if the ssh client is running under a session belonging to a username present only in the workstation's database. In this case, the <username> indicated would have to be a username present in the ACS's database).**

**Note:** For security reasons, some ssh clients do not allow just this type of authentication. To access the serial port, the ACS must be configured for local authentication. No root user should be used as username.

**Step 2: Only RhostsRSAAuthentication yes in sshd_config.**

- One of the RhostsAuthentication settings, described in Step 1.

- Client machine's host key ($ETC/ssh_host_key.pub) copied into the TS/tmp/known_hosts file. The client hostname plus the information inside this file must be appended in one single line inside the file /etc/ssh/ ssh_known_hosts or
Appendix A - New User Background Information

~/.ssh/known_hosts and IgnoreUserKnownHosts no inside sshd_config. The following commands can be used for example:

```
echo 'n 'client_hostname ' >> /etc/ssh/ssh_known_hosts or ~/.ssh/known_hosts

cat /tmp/known_hosts >> /etc/ssh/ssh_known_hosts or ~/.ssh/known_hosts
```

- client start-up command: ssh -t <ACS_ip or Serial_port_ip>

Note: “client_hostname” should be the DNS name. To access the serial port, the ACS must be configured for local authentication. No root user should be used as username.

**Step 3: Only RSAAuthentication yes in sshd_config.**

- Removal of the ACS’s *.equiv, ~/.hosts, and *known_hosts files.
- Client identity created by ssh-keygen and its public part (~/.ssh/identity.pub) copied into ACS’s ~/.ssh/authorized_keys.
- Client start-up command: ssh -t <ACS_ip or Serial_port_ip>.

**Step 4: Only PasswdAuthentication yes in sshd_config.**

- Client startup command: ssh -t -l <username> <ACS_ip or Serial_port_ip> or ssh -t <username:alias><ACS_ip>.

Configuring sshd’s client authentication using SSH Protocol version 2

Only PasswdAuthentication yes in sshd_config DSA Authentication is the default. (Make sure the parameter PubkeyAuthentication is enabled.)

- Client DSA identity created by ssh-keygen -d and its public part (~/.ssh/id_dsa.pub) copied into the ACS’s ~/.ssh/authorized_keys file.
- Password Authentication is performed if DSA key is not known to the ACS. Client start-up command: ssh -2 -t <TS_ip or Serial_port_ip>. 

AlterPath Console Server
The Process Table

The process table shows which processes are running. Type `ps -a` to see a table similar to that below.

Table 18: Process table

<table>
<thead>
<tr>
<th>PID</th>
<th>UID</th>
<th>State</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>root</td>
<td>S</td>
<td>/sbin/inetd</td>
</tr>
<tr>
<td>31</td>
<td>root</td>
<td>S</td>
<td>/sbin/sshd</td>
</tr>
<tr>
<td>32</td>
<td>root</td>
<td>S</td>
<td>/sbin/cy_ras</td>
</tr>
<tr>
<td>36</td>
<td>root</td>
<td>S</td>
<td>/sbin/cy_wdt_led wdt led</td>
</tr>
<tr>
<td>154</td>
<td>root</td>
<td>R</td>
<td>/ps -a</td>
</tr>
</tbody>
</table>

To restart the cy_ras process use its process ID or execute the command:

`signal_ras hup`

This executes the ps command, searches for the cy_ras process id, then sends the signal hup to the process, all in one step. Never kill cy_ras with the signals -9 or SIGKILL.
The ts_menu script can be used to avoid typing long telnet or ssh commands. It presents a short menu with the names of the servers connected to the serial ports of the AlterPath Console Server. The server is selected by its corresponding number. ts_menu must be executed from a local session: via console, telnet, ssh, dumb terminal connected to a serial port, etc. Only ports configured for console access (protocols socket_server or socket_ssh) will be presented. To start having familiarity with this application, run ts_menu -h:

> ts_menu -h

**USAGE:** ts_menu options

- **-p** : Display Ethernet Ip and Tcp port
- **-i** : Display local Ip assigned to the serial port
- **-u <name>** : Username to be used in ssh/telnet command
- **-U** : Allows choosing of different usernames for different ports
- **-h** : print this help message

> ts_menu

**Master and Slaves Console Server Connection Menu**

1 TSJen800
2 edson-r4.Cyclades.com
3 az84.Cyclades.com
4 64.186.190.85
5 az85.Cyclades.com

Type 'q' to quit, a valid option [1-5], or anything else to refresh:

By selecting 1 in this example, the user will access the local serial ports on that AlterPath Console Server. If the user selects 2 through 5, remote serial ports will be accessed. This is
used when there is clustering (one AlterPath Console Server master box and one or more AlterPath Console Server slave boxes).

If the user selects 1, the following screen is displayed:

Serial Console Server Connection Menu for your Master Terminal Server

1 ttyS1 2 ttyS2 3 s3serverfarm

Type 'q' to quit, 'b' to return to previous menu, a valid option[1-3], or anything else to refresh:

Options 1 to 3 in this case are serial ports configured to work as a CAS profile. Serial port 3 is presented as an alias name (s3serverfarm). When no name is configured in pslave.conf, ttyS<N> is used instead. Once the serial port is selected, the username and password for that port (in case there is a per-user access to the port and -U is passed as parameter) will be presented, and access is granted.

To access remote serial ports, the presentation will follow a similar approach to the one used for local serial ports.

The ts_menu script has the following line options:

-p : Displays Ethernet IP Address and TCP port instead of server names.

AlterPath Console Server: Serial Console Server Connection menu

1 209.81.55.79 7001 2 209.81.55.79 7002 3 209.81.55.79 7003
4 209.81.55.79 7004 5 209.81.55.79 7005 6 209.81.55.79 7006

Type 'q' to quit, a valid option [1-6], or anything else to refresh :

-i : Displays Local IP assigned to the serial port instead of server names.

AlterPath Console Server: Serial Console Server Connection menu
Appendix A - New User Background Information

1 192.168.1.101 2 192.168.1.102 3 192.168.1.103 4 192.168.1.104
5 192.168.1.105 6 192.168.1.106

Type 'q' to quit, a valid option [1-6], or anything else to refresh:

-u <name>: Username to be used in the ssh/telnet command. The default username is that
used to log onto the AlterPath Console Server.

-h : Lists script options.
The power requirements, environmental conditions and physical specifications of the AlterPath Console Server are listed below.

The following section has all the information you need to quickly and successfully purchase or build cables to the AlterPath Console Server. It focuses on information related to the RS-232 interface, which applies not only to the AlterPath Console Server but also to any RS-232 cabling.
Appendix B - Cabling, Hardware, & Electrical

Rear Panel LEDs

The ACS’ rear panel has connectors (serial, console and Ethernet) with some LEDs that have the following functionalities:

**Ethernet Connector**

- **Col** (collision): Shows collision on the LAN every time the unit tries to transmit an Ethernet packet.
- **DT/LK** (data transaction/link state): DT flashes when there's data transmitted to or received from the LAN. It's hardware-controlled. LK keeps steady if the LAN is active. The green LED is Data Transaction activity and the yellow one is Link state.
- **100**: If 100BT is detected the LED lights on. If 10BT is detected it turns off.

**Console Connector**

- **CP**: CPU activity. It flashes at roughly 1 second intervals.
- **P1**: Power supply #1 ON.
- **P2**: Power supply #2 ON.

**Serial Connector**

- **LK**: DTR. It's software-controlled.
- **DT**: Data transmitted to or received from the serial line. It's hardware-controlled.
Appendix B - Cabling, Hardware, & Electrical

The RS-232 Standard

RS-232C, EIA RS-232, or simply RS-232 refer to a standard defined by the Electronic Industries Association in 1969 for serial communication. More than 30 years later, more applications have been found for this standard than its creators could have imagined. Almost all electronic devices nowadays have serial communication ports.

RS-232 was defined to connect Data Terminal Equipment, (DTE, usually a computer or terminal) to Data Communication Equipment (DCE, usually a modem):

DTE > RS-232 > DCE > communication line > DCE > RS-232 > DTE

RS-232 is now mostly being used to connect DTE devices directly (without modems or communication lines in between). While that was not the original intention, it is possible with some wiring tricks. The relevant signals (or wires) in a RS-232 cable, from the standpoint of the computer (DTE), are:

- **Receive Data (RxD) and Transmit Data (TxD)** The actual data signals
- **Signal Ground (Gnd)** Electrical reference for both ends
- **Data Terminal Ready (DTR)** Indicates that the computer (DTE) is active
- **Data Set Ready (DSR)** Indicates that the modem (DCE) is active.
- **Data Carrier Ready (DCD)** Indicates that the connection over the communication line is active
- **CTS (Clear to Send, an input)** Flow control for data flowing from DTE to DCE
- **RTS (Request to Send, an output)** Flow control for data flowing from DCE to DTE

Not all signals are necessary for every application, so the RS-232 cable may not need all 7 wires. The RS-232 interface defines communication parameters such as parity, number of bits per character, number of stop-bits and the baud rate. Both sides must be configured with the same parameters. That is the first thing to verify if you think you have the correct cable and things still do not work. The most common configuration is 8N1 (8 bits of data per character, no parity bit included with the data, 1 stop-bit to indicate the end of a character). The baud
Appendix B - Cabling, Hardware, & Electrical

rate in a RS-232 line translates directly into the data speed in bits per second (bps). Usual transmission speeds range between 9,600 bps and 19,200bps (used in most automation and console applications) to 115,200 bps (used by the fastest modems).

Cable Length

The original RS-232 specifications were defined to work at a maximum speed of 19,200 bps over distances up to 15 meters (or about 50 feet). That was 30 years ago. Today, RS-232 interfaces can drive signals faster and through longer cables. As a general rule, consider:

- If the speed is lower than 38.4 kbps, you are safe with any cable up to 30 meters (100 feet)
- If the speed is 38.4 kbps or higher, cables should be shorter than 10 meters (30 feet)
- If your application is outside the above limits (high speed, long distances), you will need better quality (low impedance, low-capacitance) cables.

Successful RS-232 data transmission depends on many variables that are specific to each environment. The general rules above are empirical and have a lot of safety margins built-in.

Connectors

The connector traditionally used with RS-232 is the 25-pin D-shaped connector (DB-25). Most analog modems and most older computers and serial equipment use this connector. The RS-232 interface on DB-25 connector always uses the same standard pin assignment.

The 9-pin D-shaped connector (DB-9) saves some space and is also used for RS-232. Most new PC COM ports and serial equipment (specially when compact size is important) uses this connector. RS-232 interfaces on DB-9 connectors always use the same standard pin assignment.

The telephone-type modular RJ-45 plug and jack are very compact, inexpensive and compatible with the phone and Ethernet wiring systems present in most buildings and data centers. Most networking equipment and new servers use RJ-45 connectors for serial communication.
Appendix B - Cabling, Hardware, & Electrical

Unfortunately there is no standard RS-232 pin assignment for RJ-45 connectors. Every equipment vendor has its own pin assignment.

Most connectors have two versions. The ones with pins are said to be “male” and the ones with holes are said to be “female.”

**Table 23: Cables and their pin specifications**

**Straight-Through vs. Crossover Cables**

The RS-232 interface was originally intended to connect a DTE (computer, printer and other serial devices) to a DCE (modem) using a straight-through cable (all signals on one side connecting to the corresponding signals on the other side one-to-one). By using some “cabling tricks,” we can use RS-232 to connect two DTEs as is the case in most modern applications.

A crossover (a.k.a. null-modem) cable is used to connect two DTEs directly, without modems or communication lines in between. The data signals between the two sides are transmitted
Appendix B - Cabling, Hardware, & Electrical

and received and there are many variations on how the other control signals are wired. A “complete” crossover cable would connect TxD with RxD, DTR with DCD/DSR, and RTS with CTS on both sides. A “simplified” crossover cable would cross TxD and RxD and locally short-circuit DTR with DCD/DSR and RTS with CTS.

Which cable should be used?

First, look up the proper cable for your application in the table below. Next, purchase standard off-the-shelf cables from a computer store or cable vendor. For custom cables, refer to the cable diagrams to build your own cables or order them from Cyclades or a cable vendor.

Table 24: Which cable to use

Appendix B - Cabling, Hardware, & Electrical

Cable Diagrams

Before using the following cable diagrams refer to the tables above to select the correct cable for your application. Sometimes, crossover cables are wired slightly differently depending on the application. A “complete” crossover cable would connect the TxD with RxD, DTR with DCD/DSR, and RTS with CTS across both sides. A “simplified” crossover cable would cross TxD and RxD and locally short-circuit DTR with DCD/DSR and RTS with CTS.

Most of the diagrams in this document show the “complete” version of the crossover cables, with support for modem control signals and hardware flow control. Applications that do not require such features have just to configure NO hardware flow control and NO DCD detection on their side. Both ends should have the same configuration for better use of the complete version of the cables.

These cables appear in Cable Package #1 and/or Cable Package #2. You may or may not find them in your box depending on which package you received.

Cable #1: Cyclades RJ-45 to DB-25 Male, straight-through

Application: This cable connects Cyclades products (serial ports) to modems and other DCE RS-232 devices. It is included in both Cable Package #1 and #2.

![Cable Diagram](image)

Figure 32: Cable 1 - Cyclades RJ-45 to DB-25 Male, straight-through
Appendix B - Cabling, Hardware, & Electrical

Cable #2: Cyclades RJ-45 to DB-25 Female/Male, crossover

This cable connects Cyclades products (serial ports) to console ports, terminals, printers and other DTE RS-232 devices. If you are using Cable Package #1, after connecting the appropriate adapter to the RJ-45 straight-through cable, you will essentially have the cable shown in this picture. If you are using Cable Package #2, no assembly is required. You will have the cable shown below.

Figure 33: Cable 2 - Cyclades RJ-45 to DB-25 Female/Male, crossover

Cable #3: Cyclades RJ-45 to DB-9 Female, crossover

This cable connects Cyclades products (serial ports) to console ports, terminals, printers and other DTE RS-232 devices. If you are using Cable Package #1, after connecting the appropriate adapter to the RJ-45 straight-through cable, you will essentially have the cable shown in this picture. If you are using Cable Package #2, no assembly is required. You will have the cable shown below.

Figure 34: Cable 3 - Cyclades RJ-45 to DB-9 Female, crossover
Appendix B - Cabling, Hardware, & Electrical

**Cable #4: Cyclades RJ-45 to Cyclades RJ-45, straight-through**

This cable is the main cable that you will use. Along with one of the adapters provided (RJ45-to-DB9 or RJ45-to-DB25) you can create a crossover cable like the ones explained in Cable #2 or #3 for configuration or to connect to a server. This cable is only included in Cable Package #1.

Adapters

The following four adapters are included in the product box. A general diagram is provided below and then a detailed description is included for each adapter.

Loop-Back Connector for Hardware Test

The use of the following DB-25 connector is explained in the Troubleshooting chapter. It is included in both Cable Package #1 and #2.

![Loop-Back Connector Diagram](image1)

**Figure 37: Loop-Back Connector**

Cyclades/Sun Netra Adapter

This Adapter attaches to a Cat 3 or Cat 5 network cable. It is usually used in console management applications to connect Cyclades products to a Sun Netra server or to a Cisco product. At one end of the adapter is the black CAT.5e Inline Coupler box with a female RJ-45 terminus, from which a 3-inch-long black Sun Netra-labeled cord extends, terminating in an RJ-45 male connector. This adapter is included in Cable Package #2.

Appendix C - The pslave Configuration File

Introduction

This chapter begins with a table containing parameters common to all profiles, followed by tables with parameters specific to a certain profile. You can find samples of the pslave configuration files (pslave.conf, .cas, .ts, and .ras) in the /etc/portslave directory in the ACS box.

Configuration Parameters

CAS, TS, and Dial-in Common Parameters

The parameters on the following table are common to all three profiles:

Table 27: Parameters Common to CAS, TS, & Dial-in Access

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value for this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf.eth_ip</td>
<td>Configured in Task 4: Edit the pslave.conf file in Chapter 2 - Installation, Configuration, and Usage. This is the IP address of the Ethernet interface. This parameter, along with the next two, is used by the cy_ras program to OVERWRITE the file /etc/network/ifcfg_eth0 as soon as the command “signal_ras hup” is executed. The file /etc/network/ifcfg_eth0 should not be edited by the user unless the cy_ras configuration is not going to be used.</td>
<td>200.200.200.1</td>
</tr>
<tr>
<td>conf.eth_mask</td>
<td>The mask for the Ethernet network.</td>
<td>255.255.255.0</td>
</tr>
<tr>
<td>conf.eth_mtu</td>
<td>The Maximum Transmission Unit size, which determines whether or not packets should be broken up.</td>
<td>1500</td>
</tr>
</tbody>
</table>

<tr>
<td>all.flow</td>
<td>This sets the flow control to hardware, software, or none.</td>
<td>hard</td>
</tr>
<tr>
<td>all.protocol</td>
<td>The default CAS setup was explained in Chapter 2, Task 4: Edit the pslave.conf file. The TS configuration settings are in Table 29, “TS Parameters,” on page 308. The Dial-in configuration settings are in Table 30, “Dial-in configuration Parameters,” on page 310. For Power Management, see the section “Appendix J - Power Management” on page 385.</td>
<td>socket_server</td>
</tr>
<tr>
<td>s1.tty</td>
<td>The device name for the port is set to the value given in this parameter. If a device name is not provided for a port, it will not function.</td>
<td>ttyS1</td>
</tr>
</tbody>
</table>

CAS Parameters
You can configure additional CAS features with the parameters given on the following tables. (The Figure 56: Console Access Server diagram is used as an example in some parameters. Other values are default values.):

In addition to the above parameters which are common to all local and remote access scenarios, you can also configure the following parameters for additional options. Many of the parameters are unique to CAS, but some also apply to TS and Dial-in port profiles. This is indicated in these instances.
Table 28: Mostly CAS-specific Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value for this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf.nfs_data_buffering</td>
<td>This is the Remote Network File System where data captured from the serial port will be written instead of being written to the local directory /var/run/DB. The directory tree to which the file will be written must be NFS-mounted, so the remote host must have NFS installed and the administrator must create, export and allow reading/writing to this directory. The size of this file is not limited by the value of the parameter all.data_buffering, though the value cannot be zero since a zero value turns off data buffering. The size of the file is dependent on the NFS server only (hard drive, partition size, etc.).</td>
<td>commented</td>
</tr>
<tr>
<td>conf.facility</td>
<td>This value (0-7) is the Local facility sent to the syslog. The file /etc/syslogng/syslog-ng.conf contains a mapping between the facility number and the action (see more in Syslog in Chapter 3 - Additional Features).</td>
<td>7</td>
</tr>
<tr>
<td>conf.DB_facility</td>
<td>This value (0-7) is the Local facility sent to the syslog with the data when syslog_buffering is active. The file /etc/syslog-ng/syslog-ng.conf contains a mapping between the facility number and the action (see more on Syslog in Chapter 3).</td>
<td>0</td>
</tr>
<tr>
<td>conf.group</td>
<td>Used to group users to simplify configuration of the parameter all.users later on. This parameter can be used to define more than one group.</td>
<td>group_name: user1, user2</td>
</tr>
</tbody>
</table>
## Appendix C - The pslave Configuration File

### Table 28: Mostly CAS-specific Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value for this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>all.DTR_reset</td>
<td>This parameter specifies the behavior of the DTR signal in the serial port. If set to zero the DTR signal will be ON if there is a connection to the serial port, otherwise OFF. If set from 1 to 99 the DTR signal will be always ON. A value greater or equal 100 specifies for how long (in milliseconds) the DTR signal will be turned off before it is turned back on again when a connection to the serial port is closed.</td>
<td>100</td>
</tr>
<tr>
<td>all.break_sequence</td>
<td>This parameter is the string that is used to send a break to the TTY. It is only valid if TTY protocol is socket_ssh or socket_server.</td>
<td>~break</td>
</tr>
<tr>
<td>all.dcd</td>
<td>DCD signal (sets the tty parameter CLOCAL). Valid values are 0 or 1. If all.dcd=0, a connection request will be accepted regardless of the DCD signal and the connection will not be closed if the DCD signal is set to DOWN. If all.dcd=1 a connection request will be accepted only if the DCD signal is UP and the connection will be closed if the DCD signal is set to DOWN.</td>
<td>0</td>
</tr>
</tbody>
</table>
| all.issue          | This text determines the format of the login banner that is issued when a connection is made to the AlterPath Console Server. 
\nrepresents a new line and \r represents a carriage return. Expansion characters can be used here. Value for this Example: 
\r\nWelcome to terminal server %h port %p \
\r\n | See Description column |
| all.prompt         | This text defines the format of the login prompt. Expansion characters can be used here. | %h login:              |
Appendix C - The pslave Configuration File

Table 28: Mostly CAS-specific Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value for this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>all.If_suppress</td>
<td>This can be useful because telneting (from DOS) from some OS such as Windows 98 causes an extra line feed so two prompts appear whenever you press Enter. When set to 1, line feed suppression is active which will eliminate the extra prompt. When set to 0 (default), line feed suppression is not active.</td>
<td>0</td>
</tr>
<tr>
<td>all.auto_answer_input</td>
<td>This parameter works in conjunction with all.auto_answer_output. It allows you to configure a string that will be matched against all data coming in from the tty (remote server). If there is a match, the configured output string (auto_answer_output) will then be send back to the tty. This parameter works only when there is no session to the port. If uncommented and a string of bytes is set, matching occurs whenever there is not session established to the port. If this parameter is commented out, then no checking and matching occurs. (See more on the usage of this parameter in Terminal Appearance in Chapter 3.)</td>
<td>commented</td>
</tr>
<tr>
<td>all.auto_answer_output</td>
<td>This parameter works in conjunction with all.auto_answer_input. It allows you to configure a string that is sent back to the remote server whenever the incoming data remote server matches with all.auto_answer_input. This parameter works only when there is no session to the port. If this parameter is commented, then nothing will be sent back to the remote server even if all.auto_answer_input is uncommented. If this parameter is uncommented and if all.auto_answer_input is also uncommented, then the string configured will be sent back to the remote server. (See more on the usage of this parameter in Terminal Appearance in Chapter 3.)</td>
<td>commented</td>
</tr>
</tbody>
</table>
Appendix C - The pslave Configuration File

Table 28: Mostly CAS-specific Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value for this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>all.ipno</td>
<td>This is the default IP address of the AlterPath Console Server's serial ports. The “+” indicates that the first port should be addressed as 192.168.1.101 and the following ports should have consecutive values. Any host can access a port using its IP address as long as a path to the address exists in the host's routing table.</td>
<td>192.168.1.10 1+</td>
</tr>
<tr>
<td>all.poll_interval</td>
<td>Valid only for protocols socket_server and raw_data. When not set to zero, this parameter sets the wait for a TCP connection keep-alive timer. If no traffic passes through the AlterPath Console Server for this period of time, the AlterPath Console Server will send a line status message to the remote device to see if the connection is still up. If not configured, 1000 ms is assumed (the unit for this parameter is ms). If set to zero, line status messages will not be sent to the socket client.</td>
<td>0</td>
</tr>
<tr>
<td>all.socket_port</td>
<td>In the CAS profile, this defines an alternative labeling system for the AlterPath Console Server ports. The “+” after the numerical value causes the serial interfaces to be numbered consecutively. In this example, serial interface 1 is assigned the port value 7001, serial interface 2 is assigned the port value 7002, etc. One example on how this could be used is in the case of all.protocol or $n$.protocol socket_ssh and the port value (7001, 7002, etc), if supplied by the ssh client like username:port value, the ssh client will be directly connected with the serial interface. For TS, this parameter is valid only all.protocol is configured as socket_cliente or telnet. It is the TCP port number of the application that will accept connection requested by this serial port.</td>
<td>7001+</td>
</tr>
</tbody>
</table>
Appendix C - The pslave Configuration File

Table 28: Mostly CAS-specific Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value for this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>all.data_buffering</td>
<td>A non zero value activates data buffering (local or remote, according to what was configured in the parameter conf.nfs_data_buffering see Data Buffering in Chapter 3). If local data buffering, a file is created on the AlterPath Console Server; if remote, a file is created through NFS in a remote server. All data received from the port is captured in this file. If local data buffering, this parameter means the maximum file size (in bytes). If remote, this parameter is just a flag to activate (greater than zero) or deactivate data buffering. When local data buffering is used, each time the maximum is reached the oldest 10% of stored data is discarded, releasing space for new data (FIFO system) - circular file. When remote data buffering is used, there's no maximum file size other than the one imposed by the remote server - linear file. This file can be viewed using the normal Unix tools (cat, vi, more, etc.). Size is in bytes not kilobytes. See Data Buffering for details.</td>
<td>0</td>
</tr>
</tbody>
</table>

Appendix C - The pslave Configuration File

### Table 28: Mostly CAS-specific Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value for this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>all.DB_mode</td>
<td>When configured as cir for circular format, the buffer works like a revolving file at all times. The file is overwritten whenever the limit of the buffer size (as configured in all.data_buffering or s&lt;n&gt;.data_buffering) is reached. As for linear format (lin), once the limit of the kernel buffer size is reached (4k), a flow control stop (RTS off or XOFF-depending on how all.flow or s&lt;n&gt;.flow is set) is issued automatically to the remote device so that it will stop sending data to the serial port. Then, when a session is established to the serial port, the data in the buffer is shown to the user if not empty (dont_show_DBmenu parameter assumed to be 2), cleared, and a flow control start (RTS on or XON) is issued to resume data transmission. Once exiting the session, linear data buffering resumes. If all.flow or s&lt;n&gt;.flow is set to none, linear buffering is not possible as there is no way to stop reception through the serial line. Default is cir.</td>
<td>cir</td>
</tr>
<tr>
<td>all.DB_timestamp</td>
<td>Records the time stamp in the data buffering file (1) or not (0). If it is configured as 1, the software will accumulate input characters until it receives a CR and LF from the serial port or the accumulated data reaches 256 characters. Either way, the accumulated data will be recorded in the data buffering file along with the current time. The parameter all.data_buffering has to be with a non-zero value for this parameter to be meaningful.</td>
<td>0</td>
</tr>
</tbody>
</table>
### Appendix C - The pslave Configuration File

#### Table 28: Mostly CAS-specific Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value for this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>all.syslog_buffering</td>
<td>When non zero, the contents of the data buffer are sent to the syslog-ng every time a quantity of data equal to this parameter is collected. The syslog level for data buffering is hard coded to level 5 (notice) and facility local[0+conf.DB_facility]. The file /etc/syslog-ng/syslog-ng.conf should be set accordingly for the syslog-ng to take some action. (See Syslog-ng Configuration to use with Syslog Buffering Feature.)</td>
<td>0</td>
</tr>
<tr>
<td>all.syslog_sess</td>
<td>Syslog_buffering must be activated for the following to work. When 0, syslog messages are always generated whether or not there is a session to the port sending data to the unit. When 1, syslog messages are NOT generated when there IS a session to the port sending data to the unit, but resumes generation of syslog messages when there ISN’T a session to the port.</td>
<td>0</td>
</tr>
<tr>
<td>all.dont_show_DBmenu</td>
<td>When zero, a menu with data buffering options is shown when a nonempty data buffering file is found. When 1, the data buffering menu is not shown. When 2, the data buffering menu is not shown but the data buffering file is shown if not empty. When 3, the data buffering menu is shown, but without the erase and show and erase options.</td>
<td>1</td>
</tr>
<tr>
<td>all.alarm</td>
<td>When non zero, all data received from the port are captured and sent to syslog-ng with level INFO and local[0+conf.DB_facility]facility. The syslog-ng.conf file should be set accordingly, for the syslog-ng to take some action (please see Generating Alarms in Chapter 3 - Additional Features for the syslog-ng configuration file).</td>

## Table 28: Mostly CAS-specific Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value for this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>all.users</td>
<td>Restricts access to ports by user name (only the users listed can access the port or, using the character “!” , all but the users listed can access the port.) In this example, the users joe, mark and members of user_group cannot access the port. A single comma and spaces/tabs may be used between names. A comma may not appear between the “!” and the first user name. The users may be local, Radius or TacacsPlus. User groups (defined with the parameter conf.group) can be used in combination with user names in the parameter list. Notice that these are common users, not administrators.</td>
<td>!joe, mark, user_group</td>
</tr>
<tr>
<td>all.sniff_mode</td>
<td>This parameter determines what other users connected to the very same port (see parameter admin_users below) can see of the session of the first connected user (main session): in shows data written to the port, out shows data received from the port, and i/o shows both streams. The second and later sessions are called sniff sessions and this feature is activated whenever the protocol parameter is set to socket_ssh or socket_server.</td>
<td>out</td>
</tr>
<tr>
<td>all.admin_users</td>
<td>This parameter determines which users can receive the sniff session menu. Then they have options to open a sniff session or cancel a previous session. When users want access per port to be controlled by administrators, this parameter is obligatory and auth-type must not be none. User groups (defined with the parameter conf.group) can be used in combination with user names in the parameter list.</td>
<td>peter, john, user_group</td>

Appendix D - Linux-PAM

Introduction

Linux-PAM (Pluggable Authentication Modules for Linux) is a suite of shared libraries that enable the local system administrator to choose how applications authenticate users. In other words, without (rewriting and) recompiling a PAM-aware application, it is possible to switch between the authentication mechanism(s) it uses. Indeed, one may entirely upgrade the local authentication system without touching the applications themselves.

It is the purpose of the Linux-PAM project to separate the development of privilege-granting software from the development of secure and appropriate authentication schemes. This is accomplished by providing a library of functions that an application may use to request that a user be authenticated. This PAM library is configured locally with a system file, /etc/pam.conf (or a series of configuration files located in /etc/pam.d/) to authenticate a user request via the locally available authentication modules. The modules themselves will usually be located in the directory /lib/security and take the form of dynamically loadable object files.

The Linux-PAM authentication mechanism gives to the system administrator the freedom to stipulate which authentication scheme is to be used. S/he has the freedom to set the scheme for any/all PAM-aware applications on your Linux system. That is, s/he can authenticate from anything as generous as simple trust (pam_permit) to something as severe as a combination of a retinal scan, a voice print and a one-time password!

Linux-PAM deals with four separate types of (management) task. These are: authentication management, account management, session management, and password management. The association of the preferred management scheme with the behavior of an application is made with entries in the relevant Linux-PAM configuration file. The management functions are performed by modules specified in the configuration file.

Following is a figure that describes the overall organization of Linux-PAM:
Appendix D - Linux-PAM

Figure 43: Data flow diagram of Linux-PAM

The left of the figure represents the application: Application X. Such an application interfaces with the Linux-PAM library and knows none of the specifics of its configured authentication method. The Linux-PAM library (in the center) consults the contents of the PAM configuration file and loads the modules that are appropriate for Application X. These modules fall into one of four management groups (lower center) and are stacked in the order they appear in the configuration file. These modules, when called by Linux-PAM, perform the various authentication tasks for the application. Textual information, required from or offered to the user can be exchanged through the use of the application-supplied conversation function.
The Linux-PAM Configuration File

Linux-PAM is designed to provide the system administrator with a great deal of flexibility in configuring the privilege-granting applications of their system. The local configuration of those aspects of system security controlled by Linux-PAM is contained in one of two places: either the single system file /etc/pam.conf or the /etc/pam.d/ directory. In this section we discuss the correct syntax of and generic options respected by entries to these files.

Configuration File Syntax

The reader should note that the Linux-PAM-specific tokens in this file are case-insensitive. The module paths, however, are case-sensitive since they indicate a file's name and reflect the case-dependence of typical Linux file systems. The case-sensitivity of the arguments to any given module is defined for each module in turn.

In addition to the lines described below, there are two special characters provided for the convenience of the system administrator:

```
#   Comments are preceded by this character and extend to the next end-of-line.
\   This character extends the configuration lines.
```

A general configuration line of the /etc/pam.conf file has the following form:

```
Service-name module-type control-flag module-path arguments
```

The meaning of each of these tokens is explained below. The second (and more recently adopted) way of configuring Linux-PAM is via the contents of the /etc/pam.d/ directory. After the meaning of the above tokens is explained, the method will be described.
Appendix D - Linux-PAM

| Service-name | The name of the service associated with this entry. Frequently the service name is the conventional name of the given application. For example, ‘ftpd’, ‘rlogind’, ‘su’, etc. There is a special service-name, reserved for defining a default authentication mechanism. It has the name ‘OTHER’ and may be specified in either lower or upper case characters. Note, when there is a module specified for a named service, the ‘OTHER’ entries are ignored. |
| Module-type | One of (currently) the four types of module. The four types are as follows: |
| Auth- | This module type provides two aspects of authenticating the user. First, it establishes that the user is who they claim to be, by instructing the application to prompt the user for a password or other means of identification. Second, the module can grant group membership, independently of the /etc/groups, or other privileges through its credential-granting properties. |
| Account- | This module performs non-authentication-based account management. It is typically used to restrict or permit access to a service based on the time of day, currently available system resources (maximum number of users) or perhaps the location of the applicant user—‘root’ login only on the console. |
| Session- | Primarily, this module is associated with doing things that need to be done for the user before or after they can be given service. Such things include the logging of information concerning the opening or closing of some data exchange with a user, mounting directories, etc. |
| Password- | This last module type is required for updating the authentication token associated with the user. Typically, there is one module for each ‘challenge/response’ based authentication (auth) module-type. |
Appendix D - Linux-PAM

Control-flag

The control-flag is used to indicate how the PAM library will react to the success or failure of the module it is associated with. Since modules can be stacked (modules of the same type execute in series, one after another), the control-flags determine the relative importance of each module. The application is not made aware of the individual success or failure of modules listed in the `/etc/pam.conf` file. Instead, it receives a summary of success or fail responses from the Linux-PAM library. The order of execution of these modules is that of the entries in the `/etc/pam.conf` file: earlier entries are executed before later ones. The control-flag can be defined with one of two syntaxes. The simpler (and historical) syntax for the control-flag is a single keyword defined to indicate the severity of concern associated with the success or failure of a specific module. There are four such keywords: required, requisite, sufficient and optional.

The Linux-PAM library interprets these keywords in the following manner:

**Required**

This indicates that the success of the module is required for the module-type facility to succeed. Failure of this module will not be apparent to the user until all of the remaining modules (of the same module-type) have been executed.

**Requisite**

This is similar to required. However, in the case that such a module returns a failure, control is directly returned to the application. The return value is that associated with the first required or requisite module to fail. Note that this flag can be used to protect against the possibility of a user getting the opportunity to enter a password over an unsafe medium. It is conceivable that such behavior might inform an attacker of valid accounts on a system. This possibility should be weighed against the significant concerns of exposing a sensitive password in a hostile environment.

**Sufficient**

The success of this module is deemed ‘sufficient’ to satisfy the Linux-PAM library that this module-type has succeeded in its purpose. In the event that no previous required module has failed, no more ‘stacked’ modules of this type are invoked. (Note: in this case subsequent required modules are not invoked.) A failure of this module is not deemed as fatal to satisfying the application.
Appendix D - Linux-PAM

Optional

As its name suggests, this control-flag marks the module as not being critical to the success or failure of the user's application for service. In general, Linux-PAM ignores such a module when determining if the module stack will succeed or fail. However, in the absence of any definite successes or failures of previous or subsequent stacked modules this module will determine the nature of the response to the application. One example of this latter case is when the other modules return something like PAM_IGNORE.

Newest Syntax

The more elaborate (newer) syntax is much more specific and gives the administrator a great deal of control over how the user is authenticated. This form of the control flag is delimited with square brackets and consists of a series of value=action tokens:

```
[value1=action1 value2=action2 ...]
```

Here, value1 is one of the following return values: success; open_err; symbol_err; service_err; system_err; buf_err; perm_denied; auth_err; cred_insufficient; authinfo_unavail; user_unknown; maxtries; new_authtok_reqd; acct_expired; session_err; cred_unavail; cred_expired; cred_err; no_module_data; conv_err; autherr; authtok_err; authtok_recover_err; authtok_lock_busy; authtok_disable_aging; try_again; ignore; abort; authtok_expired; module_unknown; bad_item; and default. The last of these (default) can be used to set the action for those return values that are not explicitly defined.

The action can be a positive integer or one of the following tokens: ignore, ok, done, bad, die, and reset.

A positive integer

When specified as the action, can be used to indicate that the next J modules of the current type will be skipped. In this way, the administrator can develop a moderately sophisticated stack of modules with a number of different paths of execution. Which path is taken can be determined by the reactions of individual modules.

Ignore

When used with a stack of modules, the module's return status will not contribute to the return code the application obtains.
## Module Path

Module Path is the path-name of the dynamically loadable object file—the pluggable module itself. If the first character of the module path is ‘/’, it is assumed to be a complete path. If this is not the case, the given module path is appended to the default module path: /lib/security.

Currently, the AlterPath Console Server has the following modules available:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pam_access</td>
<td>Provides logdaemon style login access control.</td>
</tr>
<tr>
<td>pam_deny</td>
<td>Deny access to all users.</td>
</tr>
</tbody>
</table>
Appendix D - Linux-PAM

**pam_env**
This module allows the (un)setting of environment variables. The use of previously set environment variables as well as PAM_ITEMS such as PAM_RHOST is supported.

**pam_filter**
This module was written to offer a plug-in alternative to programs like ttysnoop (XXX - need a reference). Since a filter that performs this function has not been written, it is currently only a toy. The single filter provided with the module simply transposes upper and lower case letters in the input and output streams. (This can be very annoying and is not kind to termcap-based editors.)

**pam_group**
This module provides group settings based on the user's name and the terminal they are requesting a given service from. It takes note of the time of day.

**pam_issue**
This module presents the issue file (/etc/issue by default) when prompting for a username.

**pam_lastlog**
This session module maintains the /var/log/lastlog file. It adds an open entry when called via the pam_open_session() function and completes it when pam_close_session() is called. This module can also display a line of information about the last login of the user. If an application already performs these tasks, it is not necessary to use this module.

**pam_limits**
This module, through the Linux-PAM open-session hook, sets limits on the system resources that can be obtained in a user session. Its actions are dictated more explicitly through the configuration file discussed in /etc/security/pam_limits.conf.

**pam_listfile**
The listfile module provides a way to deny or allow services based on an arbitrary file.

**pam_motd**
This module outputs the motd file (/etc/motd by default) upon successful login.

**pam_nologin**
Provides standard Unix nologin authentication.

**pam_permit**
This module should be used with extreme caution. Its action is to always permit access. It does nothing else.

**pam_radius**
Provides Radius server authentication and accounting.
### Appendix D - Linux-PAM

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pam_rootok</td>
<td>This module is for use in situations where the superuser wishes to gain access to a service without having to enter a password.</td>
</tr>
<tr>
<td>pam_securetty</td>
<td>Provides standard UNIX securetty checking.</td>
</tr>
<tr>
<td>pam_time</td>
<td>Running a well-regulated system occasionally involves restricting access to certain services in a selective manner. This module offers some time control for access to services offered by a system. Its actions are determined with a configuration file. This module can be configured to deny access to (individual) users based on their name, the time of day, the day of week, the service they are applying for and their terminal from which they are making their request.</td>
</tr>
<tr>
<td>pam_tacplus</td>
<td>Provides TacacsPlus Server authentication, authorization (account management), and accounting (session management).</td>
</tr>
<tr>
<td>pam_unix</td>
<td>This is the standard UNIX authentication module. It uses standard calls from the system's libraries to retrieve and set account information as well as authentication. Usually this is obtained from the etc/passwd and the /etc/shadow file as well when shadow is enabled.</td>
</tr>
<tr>
<td>pam_warn</td>
<td>This module is principally for logging information about a proposed authentication or application to update a password.</td>
</tr>
<tr>
<td>pam_krb5</td>
<td>The Kerberos module currently used is pam_krb5. This PAM module requires the MIT 1.1+ release of Kerberos, or the Cygnus CNS distribution. It has not been tested against heimdal or any other Kerberos distributions. Important file: /etc/krb5.conf. The krb5.conf file contains Kerberos configuration information, including the locations of KDCs and admin servers for the Kerberos realms of interest, defaults for the current realm and for Kerberos applications, and mappings of hostnames onto Kerberos realms. Normally, you should install your krb5.conf file in the directory/etc. You can override the default location by setting the environment variable KRB5_CONFIG.</td>
</tr>
</tbody>
</table>
Appendix D - Linux-PAM

pam_ldap

Pam_ldap looks for the ldap client configuration file "ldap.conf" in /etc/.
Here’s an example of the ldap.conf file (partial):

# file name: ldap.conf

# This is the configuration file for the LDAP nameservice

# switch library and the LDAP PAM module.

#

# Your LDAP server. Must be resolvable without using LDAP.

host 127.0.0.1

# The distinguished name of the search base.
base dc=padl,dc=com

Arguments
The arguments are a list of tokens that are passed to the module when it is invoked. They are much like arguments to a typical Linux shell command. Generally, valid arguments are optional and are specific to any given module. Invalid arguments are ignored by a module, however, when encountering an invalid argument, the module is required to write an error to syslog(3).

The following are optional arguments which are likely to be understood by any module. Arguments (including these) are in general, optional.

debug
Use the syslog(3) call to log debugging information to the system log files.

no_warn
Instruct module to not give warning messages to the application.

use_first_pass
The module should not prompt the user for a password. Instead, it should obtain the previously typed password (from the preceding auth module), and use that. If that doesn’t work, then the user will not be authenticated. (This option is intended for auth and password modules only).
try_first_pass  The module should attempt authentication with the previously typed password (from the preceding auth module). If that doesn’t work, then the user is prompted for a password. (This option is intended for auth modules only).

use_mapped_pass  This argument is not currently supported by any of the modules in the Linux-PAM distribution because of possible consequences associated with U.S. encryption exporting restrictions.

expose_account  In general, the leakage of some information about user accounts is not a secure policy for modules to adopt. Sometimes information such as user names or home directories, or preferred shell, can be used to attack a user’s account. In some circumstances, however, this sort of information is not deemed a threat: displaying a user’s full name when asking them for a password in a secured environment could also be called being ‘friendly’. The expose_account argument is a standard module argument to encourage a module to be less discrete about account information as deemed appropriate by the local administrator. Any line in (one of) the configuration file(s), that is not formatted correctly will generally tend (erring on the side of caution) to make the authentication process fail. A corresponding error is written to the system log files with a call to syslog(3).

Directory-based Configuration

It is possible to configure libpam via the contents of the /etc/pam.d/ directory. This is more flexible than using the single configuration file. In this case, the directory is filled with files—each of which has a filename equal to a service-name (in lower-case)—the personal configuration file for the named service. The AlterPath Console Server Linux-PAM was compiled to use both /etc/pam.d/ and /etc/pam.conf in sequence. In this mode, entries in /etc/pam.d/ override those of /etc/pam.conf.

The syntax of each file in /etc/pam.d/ is similar to that of the /etc/pam.conf file and is made up of lines of the following form:

module-type control-flag module-path arguments
Appendix D - Linux-PAM

The only difference between the two is that the service-name is not present. The service-name is of course the name of the given configuration file. For example, /etc/pam.d/login contains the configuration for the login service.

Default Policy

If a system is to be considered secure, it had better have a reasonably secure ‘OTHER’ entry. The following is a “severe” setting (which is not a bad place to start!):

#  
# default; deny access
#  
OTHER auth required pam_deny.so
OTHER account required pam_deny.so
OTHER password required pam_deny.so
OTHER session required pam_deny.so

While fundamentally a secure default, this is not very sympathetic to a misconfigured system. For example, such a system is vulnerable to locking everyone out should the rest of the file become badly written.

The module pam_deny not very sophisticated. For example, it logs no information when it is invoked, so unless the users of a system contact the administrator when failing to execute a service application, the administrator may not know for a long while that his system is misconfigured.

The addition of the following line before those in the above example would provide a suitable warning to the administrator.

#  
# default; wake up! This application is not configured
#  

324 AlterPath Console Server
OTHER auth required pam_warn.so
OTHER password required pam_warn.so

Having two “OTHER auth” lines is an example of stacking. On a system that uses the /etc/pam.d/ configuration, the corresponding default setup would be achieved with the following file:

# # default configuration: /etc/pam.d/other
#
auth required pam_warn.so
auth required pam_deny.so
account required pam_deny.so
password required pam_warn.so
password required pam_deny.so
session required pam_deny.so

On a less sensitive computer, the following selection of lines (in /etc/pam.conf) is likely to mimic the historically familiar Linux setup:

# # default; standard UNIX access
#
OTHER auth required pam_unix_auth.so
OTHER account required pam_unix_acct.so
OTHER password required pam_unix_passwd.so
OTHER session required pam_unix_session.so

In general this will provide a starting place for most applications.
Appendix D - Linux-PAM

In addition to the normal applications: login, su, sshd, passwd, and pppd. Cyclades also has made portslave a PAM-aware application. The portslave requires four services configured in pam.conf. They are local, remote, radius, and tacplus. The portslave PAM interface takes any parameter needed to perform the authentication in the serial ports from the file pslave.conf. The pslave.conf parameter all.authtype determines which service(s) should be used.

```bash
# /etc/pam.conf
#

Appendix E - Upgrades and Troubleshooting

Upgrades

Users should upgrade the AlterPath Console Server whenever there is a bug fix or new features that they would like to have. Below are the six files added by Cyclades to the standard Linux files in the /proc/flash directory when an upgrade is needed. They are:

- boot_ori - original boot code
- boot_alt - alternate boot code
- syslog - event logs (not used by Linux)
- config - configuration parameters, only the boot parameters are used by the boot code
- zImage - Linux kernel image
- script - file where all AlterPath Console Server configuration information is stored

The Upgrade Process

To upgrade the AlterPath Console Server, follow these steps:

**Step 1:** Log in to the ACS as root.
Provide the root password if requested.

**Step 2:** Go to the /proc/flash directory using the following command:

```
cd /proc/flash
```

**Step 3:** FTP to the host where the new firmware is located.
Log in using your username and password. Go to the directory where the firmware is located. Select binary transfer and “get” the firmware file.

**Note:** The destination file name in the /proc/flash directory must be zImage. Example (hostname = server; directory = /tftpboot; username= admin; password = adminpw; firmware filename on that server = zImage.134).
Appendix E - Upgrades and Troubleshooting

ftp
> open server
> user admin
> Password: adminpw
> cd /tftpboot
> bin
> get zImage.134 zImage
> quit

Note: Due to space limitations, the new zImage file may not be downloaded with a different name, then renamed. The ACS searches for a file named zImage when booting and there is no room in flash for two zImage files.

Step 4: Run zImage.
To make sure the downloaded file is not corrupted or that the zImage saved in flash is OK the user should run:

md5sum -b /proc/flash/zImage

Step 5: Check text file information.
Now the user should check with the information present in the text file saved in the Cyclades site (e.g. zImage.134.md5sum). If the numbers match, the downloaded file is not corrupted.

Step 6: Issue the command reboot.

reboot

Step 7: Confirm that the new Linux kernel has taken over.
After rebooting, the new Linux kernel will take over. This can be confirmed by typing

cat /proc/version

to see the Linux kernel version.
Appendix E - Upgrades and Troubleshooting

Troubleshooting

Flash Memory Loss
If the contents of flash memory are lost after an upgrade, please follow the instructions below to restore your system:

**Step 1:** Turn the ACS OFF, then back ON.

**Step 2:** Using the console, wait for the self test messages.
   If you haven’t got any, make sure you have the right settings. If you really get no boot message, press <s> right after powering ON and skip ALTERNATE boot code. That will make the boot run its ORIGINAL boot code.

**Step 3:** During the self test, press <Esc> after the Ethernet test.

**Step 4:** When the Watch Dog Timer prompt appears, press <Enter>.

**Step 5:** Choose the option Network Boot when asked.

**Step 6:** Enter the IP address of the Ethernet interface.

**Step 7:** Enter the IP address of the host where the new zImage file is located.

**Step 8:** Enter the file name of the zImage file on the host.

**Step 9:** Select the TFTP option instead of BOOTP.
   The host must be running TFTP and the new zImage file must be located in the proper directory. e.g. /tftpboot for Linux.

**Step 10:** Accept the default MAC address by pressing <Enter>.
   The AlterPath Console Server should begin to boot off the network and the new image will be downloaded and begin running in RAM. At this point, follow the upgrade steps above (login, cd /proc/flash, ftp, and so forth) to save the new zImage file into flash again.
Appendix E - Upgrades and Troubleshooting

Note: Possible causes for the loss of flash memory may include: downloaded wrong zImage file, downloaded as ASCII instead of binary; problems with flash memory.

If the AlterPath Console Server booted properly, the interfaces can be verified using ifconfig and ping. If ping does not work, check the routing table using the command route. Of course, all this should be tried after checking that the cables are connected correctly.

The file /etc/config_files contains a list of files acted upon by saveconf and restoreconf. If a file is missing, it will not be loaded onto the ramdisk on boot. The following table lists files that should be included in the /etc/config_files file and which programs use each.

**Table 31: Files to be included in /etc/config_file and the program to use**

<table>
<thead>
<tr>

<tr>
<td>/etc/syslog-ng/syslog-ng.conf</td>
<td>syslog-ng</td>
</tr>
</tbody>
</table>

Important! If any of the files listed in /etc/config_files is modified, the AlterPath Console Server administrator must execute the command `saveconf` before rebooting the AlterPath Console Server or the changes will be lost. If a file is created (or a filename altered), its name must be added to this file before executing `saveconf` and rebooting.
Appendix E - Upgrades and Troubleshooting

Important! Cyclades Technical Support is always ready to help with any configuration problems. Before calling, execute the command

cat /proc/version

and note the Linux version and AlterPath Console Server version written to the screen. This will speed the resolution of most problems.

Hardware Test

A hardware test called ttest is included with the AlterPath Console Server firmware. It is a menu-driven program, run by typing ttest at the command prompt. The various options are described below. Note that the AlterPath Console Server should not be tested while in use as the test will inactivate all ports. You should inactivate all processes that may use the serial ports: inetd, sshd, cy_ras, and cy_buffering. Following are the hardware test steps:

Step 1: signal_ras stop.

Step 2: Perform all hardware tests needed.

Step 3: signal_ras start.

Port Test

Either a cross cable or a loop-back connector is necessary for this test. Their pinout diagrams are supplied in Appendix B - Cabling, Hardware, and Electrical Specifications. Connect the loop-back connector to the modem cable and then connect the modem cable to the port to be tested (or connect a cross cable between two ports to be tested). When ttest senses the presence of the cable or connector, the test will be run automatically and the result shown on the screen.

Each line of data corresponds to a port in test. The last four columns (DATA, CTS, DCD, and DSR) indicate errors. The values in these columns should be zero. Below is an example of the output screen.
Appendix E - Upgrades and Troubleshooting

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
<th>Sent</th>
<th>Received</th>
<th>Passes</th>
<th>Data</th>
<th>CTS</th>
<th>DCD</th>
<th>DSR</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>2</td>
<td>35</td>
<td>35</td>
<td>35</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>4</td>
<td>5</td>
<td>35</td>
<td>35</td>
<td>35</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>5</td>
<td>4</td>
<td>35</td>
<td>35</td>
<td>35</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

When this test is run with a cable or connector without the DSR signal (see the pinout diagram for the cable or connector being used), errors will appear in the DSR column. This does not indicate a problem with the port. In the example above, tstest perceived that a loop-back connector was attached to port 2 and that a cross cable was used to connect ports 4 and 5.

Port Conversation

This test sends and receives data on the selected port. One way to run this test is to place a loop-back connector on the port to be tested and begin. Enter the number of the port and a baud rate (9600 is a typical value). Type some letters, and if the letters appear on the screen, the port is working. If the letters do not appear on the screen (which also occurs if the loop-back connector is removed), the port is not functioning correctly.

A second method that can be used to test the port is to connect it to a modem with a straight cable. Begin the test and type “at”. The modem should respond with “OK”, which will appear on the screen. Other commands can be sent to the modem or to any other serial device. Press Ctrl-Q to exit the terminal emulation test.

Test Signals Manually

This test confirms that signals are being sent and received on the selected port. Neither the loop-back connector nor the cross cable are necessary. Enter the number of the port to be tested and begin the test.

<table>
<thead>
<tr>
<th>State</th>
<th>DTR</th>
<th>DCD</th>
<th>DSR</th>
<th>RTS</th>
<th>CTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>X</td>
<td></td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OFF</td>
<td></td>
<td>X</td>
<td></td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Figure 44: Initial test
Appendix E - Upgrades and Troubleshooting

First, type Ctrl-D to see the X in the DTR column move position, then type Ctrl-R to see the X in the RTS column change position. If each of the Xs moves in response to its command, the signals are being sent. Another method to test the signals is to use a loop-back connector. Enter the number of the port with the loopback connector and start the test. In this case, when Ctrl-D is typed, the Xs in the first three columns will move as shown below.

<table>
<thead>
<tr>
<th>State</th>
<th>DTR</th>
<th>DCD</th>
<th>DSR</th>
<th>RTS</th>
<th>CTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>CM</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>OFF</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Figure 45: Second screen, showing changed positions

This is because the test is receiving the DTR signal sent through the DCD and DSR pins. When Ctrl-R is typed, the Xs in the RTS and CTS columns should move together. If the Xs change position as described, the signals are being sent and received correctly.

Single User Mode

The AlterPath Console Server has a single user mode used when:

- The name or password of the user with root privileges is lost or forgotten,
- After an upgrade or downgrade which leaves the AlterPath Console Server unstable,
- After a configuration change which leaves the AlterPath Console Server inoperative or unstable.

Type the word "single" (with a blank space before the word) during boot using a console connection. This cannot be done using a telnet or other remote connection. The initial output of the boot process is shown below.

Entry Point = 0x00002120
loaded at: 00002120 0000D370
relocated to: 00300020 0030B270
Appendix E - Upgrades and Troubleshooting

board data at: 003052C8 0030537C
relocated to: 002FF120 002FF1D4
zimage at: 00008100 0006827E
relocated to: 00DB7000 00E1717E
initrd at: 0006827E 0024F814
relocated to: 00E18000 00FFF596
avail ram: 0030B270 00E18000
Linux/PPC load: root=/dev/ram

After printing “Linux/PPC load: root=/dev/ram,” the AlterPath Console Server waits approximately 10 seconds for user input. This is where the user should type “<sp>single” (spacebar, then the word “single”). When the boot process is complete, the Linux prompt will appear on the console:

[root@(none) /]#

If the password or username was forgotten, execute the following commands:

passwd
saveconf
reboot

For configuration problems, the user has two options:

Step 1: Edit the file(s) causing the problem with vi, then execute the commands:

saveconf
reboot

Step 2: Reset the configuration by executing the commands:

echo 0 > /proc/flash/script
reboot
Appendix E - Upgrades and Troubleshooting

If the problem is due to an upgrade/downgrade, a second downgrade/upgrade will be necessary to reverse the process. First, the network must be initialized in order to reach a ftp server. Execute the following script, replacing the parameters with values appropriate for your system. If your ftp server is on the same network as the ACS, the gw and mask parameters are optional.

```
config_eth0 ip 200.200.200.1 mask 255.255.255.0 gw 200.200.200.5
```

At this point, the DNS configuration (in the file `/etc/resolv.conf`) should be checked. Then, download the kernel image using the `ftp` command.

Troubleshooting the Web Configuration Manager

What to do when the initial Web page does not appear

Try pinging, telnetting, or tracerouting to the AlterPath Console Server to make sure it is reachable. If not, the problem is probably in the network or network configuration. Are the interfaces up? Are the IP addresses correct? Are filters configured which block the packets? If the AlterPath Console Server is reachable, see if the `/bin/webs` process is running by executing the command `ps`. If it is not, type `/bin/webs &` to start it. If the `/bin/webs` process is not being initialized during boot, change the file `/etc/inittab`.

How to restore the Default Configuration of the Web Configuration Manager

This would be required only when the root password was lost or the configuration file `/etc/websum.conf` was damaged. From a console or telnet session, edit the file `/etc/config_files`. Find the reference to `/etc/websum.conf` and delete it. Save the modified `/etc/config_files` file. Execute the command `saveconf`. Reboot the system. Enter into the Web Configuration Manager with the default username and password (root/tslinux). Edit the file `/etc/config_files` and insert the reference to `/etc/websum.conf`.

Using a different speed for the Serial Console

The serial console is originally configured to work at 9600 bps. If you want to change that, it is necessary to change the configuration following the steps:

**Step 1:** Run `bootconf`. The user will be presented with the screen:

```
Current configuration

MAC address assigned to Ethernet [00:60:2e:00:16:b9]
```
Appendix E - Upgrades and Troubleshooting

IP address assigned to Ethernet interface [192.168.160.10]
Watchdog timer ((A)ctive or (I)nactive) [A]
Firmware boot from ((F)lash or (N)etwork) [F]
Boot type ((B)ootp,(T)ftp or Bot(H)) [T]
Boot File Name [zvmppctsbin]
Server's IP address [192.168.160.1]
Console speed [9600]
(P)erform or (S)kip Flash test [P]
(S)kip, (Q)uick or (F)ull RAM test [F]
Fast Ethernet ((A)uto Neg, (1)00 Bt(H), 100 Bt(F), 10 B(t)F, 10 Bt(H)) [A]
Fast Ethernet Maximum Interrupt Events [0]

Type <Enter> for all fields but the Console Speed. When presented the following line:
Do you confirm these changes in flash ( (Y)es, (N)o (Q)uit ) [N] :

Step 2: Enter Y and the changes will be saved in flash.

Step 3: Logout and login again to use the console at the new speed.

CPU LED

Normally the CPU status LED should blink consistently one second on, one second off. If this is not the case, an error has been detected during the boot. The blink pattern can be interpreted via the following table:
## Table 32: CPU LED Code Interpretation

<table>
<thead>
<tr>
<th>Event</th>
<th>CPU LED Morse code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal Operation</td>
<td>S (short, short, short . . . )</td>
</tr>
<tr>
<td>Flash Memory Error - Code</td>
<td>L (long, long, long . . . )</td>
</tr>
<tr>
<td>Flash Memory Error - Configuration</td>
<td>S, L</td>
</tr>
<tr>
<td>Ethernet Error</td>
<td>S, S, L</td>
</tr>
<tr>
<td>No Interface Card Detected</td>
<td>S, S, S, L</td>
</tr>
<tr>
<td>Network Boot Error</td>
<td>S, S, S, S, L</td>
</tr>
<tr>
<td>Real-Time Clock Error</td>
<td>S, S, S, S, S, L</td>
</tr>
</tbody>
</table>

**Note:** The Ethernet error mentioned in the above table will occur automatically if the Fast Ethernet link is not connected to an external hub during the boot. If the Fast Ethernet is not being used or is connected later, this error can be ignored.
Appendix F - Certificate for HTTP Security

Introduction

The following configuration will enable you to obtaining a Signed Digital Certificate. A certificate for the HTTP security is created by a CA (Certificate Authority). Certificates are most commonly obtained through generating public and private keys, using a public key algorithm like RSA or X509. The keys can be generated by using a key generator software.

Procedure

Step 1: Enter OpenSSL command.

On a Linux computer, key generation can be done using the OpenSSL package, through the following command:

```
# openssl req -new -nodes -keyout private.key -out public.csr
```

If this command is used, the following information is required:

Table 33: Required information for the OpenSSL package

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Country Name (2 letter code) [AU]:</td>
<td>The country code consisting of two letters.</td>
</tr>
<tr>
<td>State or Province Name (full name) [Some-State]:</td>
<td>Provide the full name (not the code) of the state.</td>
</tr>
<tr>
<td>Locality Name (e.g., city) []:</td>
<td>Enter the name of your city.</td>
</tr>
<tr>
<td>Organization Name (e.g., company) [Internet Widgits Ltd]:</td>
<td>Organization that you work for or want to obtain the certificate for.</td>
</tr>
<tr>
<td>Organizational Unit Name (e.g., section) []:</td>
<td>Department or section where you work.</td>
</tr>
<tr>
<td>Common Name (e.g., your name or your server’s hostname) []:</td>
<td>Name of the machine where the certificate must be installed.</td>
</tr>
</tbody>
</table>
The other requested information can be skipped.

The certificate signing request (CSR) generated by the command above contains some personal (or corporate) information and its public key.

**Step 2: Submit CSR to the CA.**

The next step is to submit the CSR and some personal data to the CA. This service can be requested by accessing the CA Web site and is not free. There is a list of CAs at the following URL

pki-page.org

The request will be analyzed by the CA, for policy approval and to be signed.

**Step 3: Upon receipt, install certificate.**

After the approval, the CA will send a certificate file to the origin, which we will call Cert.cer, for example purposes. The certificate is also stored on a directory server. The certificate must be installed in the GoAhead Web server, by following these instructions:

**Step A:** Open a Cyclades Terminal Server session and do the login.

**Step B:** Join the certificate with the private key into the file /web/server.pem.

```
#cat Cert.cer private.key > /web/server.pem
```

**Step C:** Copy the certificate to the file /web/cert.pem.

```
#cp Cert.cer /web/cert.pem
```

**Step D:** Include the files /web/server.pem and /web/cert.pem in /etc/config_files.
Appendix F - Certificate for HTTP Security

Step E:  Save the configuration in flash.

   #saveconf

Step F:  The certification will be effective in the next reboot.
Appendix F - Certificate for HTTP Security

This page has been left intentionally blank.
Appendix G - IPSEC

Introduction

IPsec, Security for the Internet Protocol

FreeS/WAN is a Linux implementation of the IPsec (IP security) protocols. IPsec provides encryption and authentication services at the IP (Internet Protocol) level of the network protocol stack.

Working at this level, IPsec can protect any traffic carried over IP, unlike other encryption which generally protects only a particular higher-level protocol—PGP for mail, SSH for remote login, SSL for Web work, and so on.

Applications of IPsec

Because IPsec operates at the network layer, it is remarkably flexible and can be used to secure nearly any type of Internet traffic. Two applications, however, are extremely widespread:

- A Virtual Private Network, or VPN, allows multiple sites to communicate with the Console Server securely over an insecure Internet by encrypting all communication between the sites and the Console Server.
- “Road Warriors” connect to the Console Server from home, or perhaps from a hotel somewhere.

A somewhat more detailed description of each of these applications is below. Our Quick Start section will show you how to build each of them.

Using secure tunnels to create a VPN

A VPN, or Virtual Private Network lets the Console Server and a whole network communicate securely when the only connection between them is over a third network which is not trustable. The method is to put a security gateway machine in the network and create a security tunnel between the Console Server and this gateway. The gateway machine and the Console Server encrypt packets entering the untrusted net and decrypt packets leaving it, creating a secure tunnel through it.
Appendix G - IPSEC

Road Warriors

The prototypical “Road Warrior” is a traveller connecting to the Console Server from a laptop machine. For purposes of this document:

- Anyone with a dynamic IP address is a “Road Warrior.”
- Any machine doing IPsec processing is a “gateway.” Think of the single-user Road Warrior machine as a gateway with a degenerate subnet (one machine, itself) behind it.

These require somewhat different setup than VPN gateways with static addresses and with client systems behind them, but are basically not problematic. There are some difficulties which appear for some Road Warrior connections:

- Road Warriors who get their addresses via DHCP may have a problem. FreeS/WAN can quite happily build and use a tunnel to such an address, but when the DHCP lease expires, FreeS/WAN does not know that. The tunnel fails, and the only recovery method is to tear it down and rebuild it.

- If Network Address Translation (NAT) is applied between the two IPsec Gateways, this breaks IPsec. IPsec authenticates packets on an end-to-end basis, to ensure they are not altered en route. NAT rewrites packets as they go by.

In most situations, however, FreeS/WAN supports Road Warrior connections just fine.

Configuration

Before you start

Set up and test networking

Before trying to get FreeS/WAN working, you should configure and test IP networking on the Console Server and on the other end. IPsec cannot work without a working IP network beneath it.

Many reported “FreeS/WAN problems” turn out to actually be problems with routing or fire-walling. If any actual IPsec problems turn up, you often cannot even recognize them (much less debug them) unless the underlying network is right.
Appendix G - IPSEC

Enabling IPsec
The IPsec is disabled by default in the Console Server family. To enable it you must edit the file /etc/inittab and /etc/config_files and uncomment the lines regarding the IPsec. After performing these changes you must save the configuration using the saveconf tool and reboot the equipment.

Quick Start
This is a quick guide to set up two common configurations: VPN and Road Warrior. There are three examples: one Road Warrior using RSA signature, one VPN using RSA signature and one VPN using shared secret(s). It will assume the other end is also running the FreeS/Wan. If it is not your case make the appropriate conversions for your IPsec software.

“Road Warrior” remote access
A common requirement is for connections between a Console Server and some set of remote machines. For example, one administrator may want to access the Console Server from wherever he might be. We refer to the remote machines as “Road Warriors.” For purposes of IPsec, anyone with a dynamic IP address is a Road Warrior.

Information exchange
To set up a Road Warrior connection, you need some information about the system on the other end. Connection descriptions use left and right to designate the two ends. We adopt the convention that, from the Console Server’s point of view, left = local and right = remote. The Console Server administrator needs to know some things about each Road Warrior:

- The system’s public key (for RSA only).
- The ID that system uses in IPsec negotiation.

To get system’s public key in a format suitable for insertion directly into the Console Server’s ipsec.conf file, issue this command on the warrior machine:

/usr/local/sbin/ipsec showhostkey --right

The output should look like this (with the key shortened for easy reading):

rightrsasigkey=0s1LgR7/oUM...

The Road Warrior needs to know:
Appendix G - IPSEC

- the Console Server's public key or the secret, and
- the ID the Console Server uses in IPsec negotiation

which can be generated by running /usr/local/sbin/ipsec showhostkey -left on the Console Server. Each warrior must also know:

- The IP address of the Console Server.

This information should be provided in a convenient format, ready for insertion in the warrior's ipsec.conf file. For example:

```
left=1.2.3.4
leftid=@acs.example.com
leftrsa sigkey=0s1LgR7/oUM...
```

The Console Server administrator typically needs to generate this only once. The same file can be given to all warriors.

Setup on the Road Warrior machine

Simply add a connection description us-to-Console Server, with the left and right information you gathered above to the ipsec.conf file. This might look like:

```
# pre-configured link to Console Server

conn us-to-acs

  # information obtained from Console Server admin
  left=1.2.3.4               # Console Server IP address
  leftid=@acs.example.com

  # real keys are much longer than shown here
  leftrsa sigkey=0s1LgR7/oUM...

  # warrior stuff
  right=%defaultroute
  rightid=@xy.example.com
```
Appendix G - IPSEC

rightrsasigkey=0s1LgR7/oUM

Road warrior support on the Console Server

Adding Road Warrior support so people can connect remotely to your Console Server is straightforward.

conn gate-xy
  left=1.2.3.4
  leftid=@acs.example.com
  leftrsasigkey=0s1LgR7/oUM...
  # allow connection attempt from any address
  # attempt fails if caller cannot authenticate
  right=%any
  # authentication information
  rightid=@xy.example.com
  rightrsasigkey=0s1LgR7/oUM...

ACS-to-network VPN

Often it may be useful to have explicitly configured IPsec tunnels between the Console Server and a gateway of an office with a fixed IP address (in this case every machine on the office network would have a secure connection with the Console Server), or between the Console Server and the Console Server administrator machine, which must, in this case, have a fixed IP address.

To do it just insert this connection description to your ipsec.conf file with the variables that fit your environment:

# sample tunnel
# The network here looks like:
#   ACS----acsnexthop......rightnexthop----right====rightsubnet
# If ACS and right are on the same Ethernet, omit leftnexthop and rightnexthop.
Appendix G - IPSEC

conn sample
    # ACS
    left=10.0.0.1
    leftid=@acs.example.com
    # next hop to reach right
    leftnexthop=10.44.55.66
    # This line is only for RSA signature
    leftrsasigkey=0s1LgR7/oUM...
    # right s.g., subnet behind it, and next hop to reach left
    right=10.12.12.1
    rightid=@xy.example.com
    rightnexthop=10.88.77.66
    rightsubnet=192.168.0.0/24
    auto=start
    # This line is only for RSA signature
    rightrsasigkey=0s1LgR7/oUM...
    # This line is only for shared secret
    authby=secret

If you want to use shared secrets you must insert the following line to the ipsec.secrets file:
10.0.0.1 10.12.12.1 : PSK "secret"

The good part is that this connection descriptor and the secret line can be added to both the Console Server and the other end. This is the advantage of use left and right instead of using local remote parameters.

If you give an explicit IP address for left (and left and right are not directly connected), then you must specify leftnexthop (the router which Console Server sends packets to in order to
Appendix G - IPSEC

get them delivered to right). Similarly, you may need to specify rightnexthop (vice versa).
The nexthop parameters are needed because of an unfortunate interaction between FreeS/WAN and the Linux kernel routing code. They will be eliminated in a future release, but perhaps not soon. We know they should go, but getting them out is not a simple problem.

Setting up RSA authentication keys

To build a connection, the Console Server and the other end must be able to authenticate each other. For FreeS/WAN, the default is public key authentication based on the RSA algorithm. IPsec does allow several other authentication methods.

Generating an RSA key pair

The Console Server doesn't have an RSA key pair by default. It will be generated on the first reboot after you have uncommented the IPsec lines in the file /etc/inittab. You also can generate your key pair by issuing the following commands as root:

- /usr/local/sbin/ipsec newhostkey --bits <key length> --output /etc/ipsec.secrets
- chmod 600 /etc/ipsec.secrets

Key generation may take some time. Also, it needs a lot of random numbers so it needs traffic on the Console Server ethernet port. The Console Server uses the traffic on the ethernet to generate its random numbers. It is also possible to use keys in other formats, not generated by FreeS/WAN. This may be necessary for interoperation with other IPsec implementations.

Exchanging authentication keys

Once your ACS's key is in ipsec.secrets, the next step is to send your public key to everyone you need to set up connections with and collect their public keys. The other players will be:

- For a VPN: each ACS administrator needs public keys for all gateways his or her ACS talks to.
- For a Road Warrior: the ACS needs public keys for all Warriors that connect to it, and each Warrior needs the ACS public key.

You need to extract the public part in a suitable format. This is done with the ipsec_showhostkey command. For VPN or Road Warrior applications, use one of the following:

/usr/local/sbin/ipsec showhostkey --left
Appendix G - IPSEC

/usr/local/sbin/ipsec showhostkey --right

These two produce the key formatted for insertion in an ipsec.conf file.

Public keys need not be protected as fanatically as private keys. They are intended to be made public; the system is designed to work even if an enemy knows all the public keys used. You can safely make them publicly accessible. For example, put a gateway key on a Web page or make it available in DNS—or transmit it with an insecure method such as email.

The Configuration File

Description

The ipsec.conf file specifies most configuration and control information for the FreeS/WAN IPsec subsystem. (The major exception is secrets for authentication; ipsec.secrets) Its contents are not security-sensitive unless manual keying is being done for more than just testing, in which case the encryption/authentication keys in the descriptions for the manually-keyed connections are very sensitive (and those connection descriptions are probably best kept in a separate file, via the include facility described below).

The file is a text file, consisting of one or more sections. White space followed by # followed by anything to the end of the line is a comment and is ignored, as are empty lines which are not within a section.

A line which contains include and a file name, separated by white space, is replaced by the contents of that file, preceded and followed by empty lines. If the file name is not a full pathname, it is considered to be relative to the directory containing the including file. Such inclusions can be nested. Only a single filename may be supplied, and it may not contain white space, but it may include shell wildcards for example:

include ipsec.*.conf

The intention of the include facility is mostly to permit keeping information on connections, or sets of connections, separate from the main configuration file. This permits such connection descriptions to be changed, copied to the other security gateways involved, etc., without having to constantly extract them from the configuration file and then insert them back into it. Note the also parameter (described below) which permits splitting a single logical section (e.g., a connection description) into several actual sections.
A section begins with a line of the form:

```
type name
```

where type indicates what type of section follows, and name is an arbitrary name which distinguishes the section from others of the same type. (Names must start with a letter and may contain only letters, digits, periods, underscores, and hyphens.) All subsequent non-empty lines which begin with white space are part of the section; comments within a section must begin with white space too. There may be only one section of a given type with a given name.

Lines within the section are generally of the following form:

```
parameter=value
```

(Note the mandatory preceding white space.) There can be white space on either side of the `=`, Parameter names follow the same syntax as section names, and are specific to a section type. Unless otherwise explicitly specified, no parameter name may appear more than once in a section.

An empty value stands for the system default value (if any) of the parameter, i.e., it is roughly equivalent to omitting the parameter line entirely. A value may contain white space only if the entire value is enclosed in double quotes (`"`); a value cannot itself contain a double quote, nor may it be continued across more than one line.

Numeric values are specified to be either an integer (a sequence of digits) or a decimal number (sequence of digits optionally followed by "." and another sequence of digits).

There is currently one parameter which is available in any type of section:

```
also
```

The value is a section name; the parameters of that section are appended to this section, as if they had been written as part of it. The specified section must exist, must follow the current one, and must have the same section type. (Nesting is permitted, and there may be more than one also in a single section, although it is forbidden to append the same section more than once.) This allows, for example, keeping the encryption keys for a connection in a separate file from the rest of the description, by using both an also parameter and an include line.

A section with name `%default` specifies defaults for sections of the same type. For each parameter in it, any section of that type which does not have a parameter of the same name gets a copy of the one from the `%default` section. There may be multiple `%default` sections of
Appendix G - IPSEC

a given type, but only one default may be supplied for any specific parameter name, and all
%default sections of a given type must precede all non-%default sections of that type. %default
sections may not contain also parameters.

Currently there are two types of sections: a config section specifies general configuration
information for IPsec, while a conn section specifies an IPsec connection.

Conn Sections
A conn section contains a connection specification, defining a network connection to be
made using IPsec. The name given is arbitrary, and is used to identify the connection to
ipsec_auto and ipsec_manual. Here's a simple example:

conn snt
left=10.11.11.1
leftsubnet=10.0.1.0/24
leftnexthop=172.16.55.66
right=192.168.22.1
rightsubnet=10.0.2.0/24
rightnexthop=172.16.88.99
keyingtries=0 # be very persistent

Terminology Note: In automatic keying, there are two kinds of communications
going on: transmission of user IP packets, and gateway-to-gateway negotiations
for keying, rekeying, and general control. The data path (a set of "IPsec SAs")
used for user packets is hereon referred to as the "connection." The path used
for negotiations (built with "ISAKMP SAs") is referred to as the "keying chan-
nel."

To avoid trivial editing of the configuration file to suit it to each system involved in a connec-
tion, connection specifications are written in terms of left and right participants, rather than
in terms of local and remote. Which participant is considered left or right is arbitrary; IPsec
figures out which one it is being run on based on internal information. This permits using identical connection specifications on both ends.

Many of the parameters relate to one participant or the other; only the ones for left are listed here, but every parameter whose name begins with left has a right counterpart, whose description is the same but with left and right reversed.

Parameters are optional unless marked **required**; a parameter required for manual keying need not be included for a connection which will use only automatic keying, and vice versa.

### Conn. Parameters—General

The following parameters are relevant to both automatic and manual keying. Unless otherwise noted, for a connection to work, in general it is necessary for the two ends to agree exactly on the values of these parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>

<tr>
<td><strong>leftnexthop</strong></td>
<td>Next-hop gateway IP address for the left participant's connection to the</td>
</tr>
<tr>
<td></td>
<td>public network. Defaults to %direct (meaning right).</td>
</tr>
</tbody>
</table>
Appendix G - IPSEC

leftupdown       What updown script to run to adjust routing and/or firewalling when the
status of the connection changes.

Conn Parameters: Automatic Keying

The following parameters are relevant only to automatic keying, and are ignored in manual
keying. Unless otherwise noted, for a connection to work, in general it is necessary for the
two ends to agree exactly on the values of these parameters.

auto       What operation, if any, should be done automatically at IPsec startup; cur-
cently-accepted values are add (signifying an ipsec auto --add), route (sig-
nifying that plus an ipsec auto --route), start (signifying that plus an ipsec
auto --up), and ignore (also the default) (signifying no automatic startup
operation). This parameter is ignored unless the plutoload or plutostart
configuration parameter is set suitably; see the config setup discussion
below.

auth        Whether authentication should be done as part of ESP encryption, or sep-
arily using the AH protocol, acceptable values are esp (the default) and
ah.

authby      How the two security gateways should authenticate each other. Accept-
able values are secret for shared secrets (the default) and rsasig for RSA
digital signatures.

leftid      How the left participant should be identified for authentication. Defaults
to left. Can be an IP address or a fully-qualified domain name preceded by
@ (which is used as a literal string and not resolved).
Appendix G - IPSEC

leftrsa sigkey

The left participant's public key for RSA signature authentication, in RFC 2537 format. The magic value %none means the same as not specifying a value (useful to override a default). The value %dnsondemand means the key is to be fetched from DNS at the time it is needed. The value %dnsonload means the key is to be fetched from DNS at the time the connection description is read from ipsec.conf. Currently this is treated as %none if right=%any or right=%opportunistic. The value %dns is currently treated as %dnsonload but will change to %dnsondemand in the future. The identity used for the left participant must be a specific host, not %any or another magic value. Caution: if two connection descriptions specify different public keys for the same leftid, confusion and madness will ensue.

pfs

Whether Perfect Forward Secrecy of keys is desired on the connection's keying channel. (With PFS, penetration of the key-exchange protocol does not compromise keys negotiated earlier.) Acceptable values are yes (the default) and no.

keylife

How long a particular instance of a connection (a set of encryption/authentication keys for user packets) should last, from successful negotiation to expiry; acceptable values are an integer optionally followed by s (a time in seconds) or a decimal number followed by m, h, or d (a time in minutes, hours, or days respectively) (default 8.0h, maximum 24h).

rekey

Whether a connection should be renegotiated when it is about to expire; acceptable values are yes (the default) and no.

rekeymargin

How long before connection expiry or keying-channel expiry should attempts to negotiate a replacement begin; acceptable values as for keylife (default 9m).

rekeyfuzz

Maximum percentage by which rekeymargin should be randomly increased to randomize rekeying intervals (important for hosts with many connections). Acceptable values are an integer, which may exceed 100, followed by a "%".

keyingtries

how many attempts (an integer) should be made to negotiate a connection, or a replacement for one, before giving up (default 3). The value 0 means "never give up."

ikelifetime

How long the keying channel of a connection (buzzphrase: ISAKMP SA) should last before being renegotiated. Acceptable values as for keylife.
Appendix G - IPSEC

**compress**  
Whether IPComp compression of content is desired on the connection.  
Acceptable values are yes and no (the default).

**Conn Parameters: Manual Keying**  
The following parameters are relevant only to manual keying, and are ignored in automatic keying. Unless otherwise noted, for a connection to work, in general it is necessary for the two ends to agree exactly on the values of these parameters. A manually-keyed connection must specify at least one of AH or ESP.

- **spi or spibase**: This or spibase required for manual keying) the SPI number to be used for the connection. Must be of the form 0xhex, where hex is one or more hexadecimal digits. (Note: it will generally be necessary to make spi at least 0x100 to be acceptable to KLIPS, and use of SPIs in the range 0x100-0xfff is recommended.)
- **esp**: ESP encryption/authentication algorithm to be used for the connection, e.g. 3des-md5-96.
- **espenckey**: ESP encryption key.
- **espauthkey**: ESP authentication key.
- **espreplay_window**: ESP replay-window setting. An integer from 0 to 64. Relevant only if ESP authentication is being used.
- **leftespspi**: SPI to be used for the leftward ESP SA, overriding automatic assignment using spi or spibase. Typically a hexadecimal number beginning with 0x.
- **ah**: AH authentication algorithm to be used for the connection, e.g. hmac-md5-96. Default is not to use AH.
- **ahkey**: Required if ah is present. AH authentication key
- **ahreplay_window**: AH replay-window setting. An integer from 0 to 64.
- **leftahspi**: SPI to be used for the leftward AH SA, overriding automatic assignment using spi or spibase. Typically a hexadecimal number beginning with 0x.
Appendix G - IPSEC

Config Sections

At present, the only config section known to the IPsec software is the one named setup, which contains information used when the software is being started. Here’s an example:

```plaintext
config setup
  interfaces="ipsec0=eth1 ipsec1=ppp0"
  klipsdebug=none
  plutodebug=all
  manualstart=
  plutoload="snta sntb sntc sntd"
  plutostart=
```

Parameters are optional unless marked “(required).” The currently-accepted parameter names in a config setup section are:

- **interfaces**: Required. Virtual and physical interfaces for IPsec to use: a single virtual=physical pair, a (quoted!) list of pairs separated by white space, or %defaultroute, which means to find the interface d that the default route points to, and then act as if the value was “ipsec0=d.”
- **forwardcontrol**: Whether setup should turn IP forwarding on (if it’s not already on) as IPsec is started, and turn it off again (if it was off) as IPsec is stopped. Acceptable values are yes and (the default) no.
- **klipsdebug**: How much KLIPS debugging output should be logged. An empty value, or the magic value none, means no debugging output (the default). The magic value all means full output.
- **plutodebug**: How much Pluto debugging output should be logged. An empty value, or the magic value none, means no debugging output (the default). The magic value all means full output.
- **dumpdir**: In what directory should things started by setup (notably the Pluto daemon) be allowed to dump core? The empty value (the default) means they are not allowed to.
### Appendix G - IPSEC

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>manualstart</td>
<td>Which manually-keyed connections to set up at startup (empty, a name, or a quoted list of names separated by white space).</td>
</tr>
<tr>
<td>plutoload</td>
<td>Which connections (by name) to load into Pluto's internal database at startup (empty, a name, or a quoted list of names separated by white space); see ipsec auto for details. Default is none. If the special value %search is used, all connections with auto=add, auto=route, or auto=start are loaded.</td>
</tr>
<tr>
<td>plutostart</td>
<td>Which connections (by name) to attempt to negotiate at startup (empty, a name, or a quoted list of names separated by white space). Any such names which do not appear in plutoload are implicitly added to it. Default is none. If the special value %search is used, all connections with auto=route or auto=start are routed, and all connections with auto=start are started.</td>
</tr>
<tr>
<td>plutowait</td>
<td>Should Pluto wait for each plutostart negotiation attempt to finish before proceeding with the next? Values are yes (the default) or no.</td>
</tr>
<tr>
<td>prepluto</td>
<td>Shell command to run before starting Pluto. For example, to decrypt an encrypted copy of the ipsec.secrets file). It's run in a very simple way. Complexities like I/O redirection are best hidden within a script. Any output is redirected for logging, so running interactive commands is difficult unless they use /dev/tty or equivalent for their interaction. Default is none.</td>
</tr>
<tr>
<td>postpluto</td>
<td>Shell command to run after starting Pluto (e.g., to remove a decrypted copy of the ipsec.secrets file).</td>
</tr>
<tr>
<td>fragicmp</td>
<td>Whether a tunnel's need to fragment a packet should be reported back with an ICMP message, in an attempt to make the sender lower his PMTU estimate. Acceptable values are yes (the default) and no.</td>
</tr>
<tr>
<td>packetdefault</td>
<td>What should be done with a packet which reaches KLIPS (via a route into a virtual interface) but does not match any eroute; Acceptable values are pass (insecure unless you really know what you're doing!!), drop (the default), and reject (currently same as drop).</td>
</tr>
<tr>
<td>hidetos</td>
<td>Whether a tunnel packet's TOS field should be set to 0 rather than copied from the user packet inside. Acceptable values are yes (the default) and no.</td>
</tr>
</tbody>
</table>
Appendix G - IPSEC

uniqueids

Whether a particular participant ID should be kept unique, with any new (automatically keyed) connection using an ID from a different IP address deemed to replace all old ones using that ID. Acceptable values are yes and no (the default).

overridemtu

Value that the MTU of the ipsecn interface(s) should be set to, overriding IPsec’s (large) default. This parameter is needed only in special situations.

Recommended Configuration

Certain parameters are now strongly-recommended defaults, but cannot (yet) be made system defaults due to backward compatibility. Recommended config setup parameters are:

- `plutoload=%search`
- `plutostart=%search`

In practice, it is preferable to use the auto parameter to control whether a particular connection is added or started automatically.

uniqueids=yes

Participant IDs normally are unique, so a new (automatically-keyed) connection using the same ID is almost invariably intended to replace an old one.

keyingtries=0

Unlimited retries are normally appropriate for VPN connections. Finite values may be needed for Road Warrior and other more ephemeral applications, but the fixed small default is pretty much useless.

disablearrivalcheck=no

Tunnel-exit checks improve security and do not break any normal configuration.

authby=rsasig

Digital signatures are superior in every way to shared secrets.
Appendix G - IPSEC

IPsec Usage

This section will teach you:

- How to start and stop the IPsec daemon.
- How to add and remove an IPsec connection from the IPsec database.
- How to start and stop a connection.

The IPsec Daemon

The ipsec daemon is automatically initialized when you first boot your Console Server equipment after you have uncommented the IPsec lines in the /etc/inittab and /etc/config_files. Rebooting your ACS is not mandatory. However, you can start the IPsec daemon by using the command:

/usr/local/sbin/ipsec setup

This program accepts the options: --start, --stop, and --restart.

Adding and Removing a Connection

All the connections can be loaded to the IPsec database at boot time if these connections have the auto parameter set to add. However, if a certain connection doesn't have this option set and you wish to add this connection manually you can use the following command:

/usr/local/sbin/ipsec (auto/manual) --add <connection name>

You must use auto or manual depending on your connection keying type (manual/auto). Similarly to take a connection out of the IPsec database you can use the command:

/usr/local/sbin/ipsec (auto/manual) --delete <connection name>

Once a connection descriptor is in the IPsec internal database, IPsec will accept the other end to start the security connection negotiation. You can also start its negotiation as explained in the next chapter.
Appendix G - IPSEC

Starting and Stopping a Connection

All the connections can be negotiated at boot time if these connections have the auto parameter set to start. However, if a certain connection doesn’t have this option set, you can set it. Once a connection descriptor is in the IPsec internal database, you can start its negotiation using the command:

```
/usr/local/sbin/ipsec (auto/manual) --up <connection name>
```

Similarly, to close a tunnel, you use the command:

```
/usr/local/sbin/ipsec (auto/manual) --down <connection name>
```
This page has been left intentionally blank.
Appendix H - Web User Management

Introduction

In the ACS Web server, the user database is completely separated from the system's (as defined in the /etc/passwd file), and the logic used for managing permissions is also different. The Web's user database is stored in the /etc/websum.conf file, and it has basically three lists: users, user groups and access limits.

Default Configuration for Web User Management

The following three screen shots show the default configuration for User List, User Group List, and Access Limit List pages, respectively.

Appendix H - Web User Management

### How Web User Management works

When a user logs in, the username and the password are encrypted and stored in the browser. Whenever a URL is requested, the User Manager will perform the following tasks:

<table>
<thead>
<tr>
<th>Entry</th>
<th>URL</th>
<th>Privilege Level</th>
<th>Access Method</th>
<th>Secure</th>
</tr>
</thead>
<tbody>
<tr>
<td>/</td>
<td>USER</td>
<td>FULL</td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>/admin</td>
<td>USER</td>
<td>COOKIE</td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>/adm</td>
<td>ADMINISTRATOR</td>
<td>COOKIE</td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>/cfg</td>
<td>FULL</td>
<td>COOKIE</td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>/full</td>
<td>FULL</td>
<td>COOKIE</td>
<td></td>
<td>No</td>
</tr>
<tr>
<td>/goformv</td>
<td>USER</td>
<td>COOKIE</td>

</tr>
</tbody>
</table>

Figure 48: Access Limit List default page
Appendix H - Web User Management

Task 1: Check the URL in the Access Limit List

The Web server first scans for the full URL, and then it looks for the subdirectories, until reaching the root directory "/." (In the URL http://CAS/goform/iptablesRulesHandle, the access limits will be scanned in the following order: /goform/iptablesRulesHandle, /goform/fg, /goform and /.) When the URL matches an Access Limit, the following information will be available:

Accessibility  When configured as FULL ACCESS, the URL can be accessed without any authentication; otherwise, the user can authenticate with BASIC, DIGEST or COOKIE authentication. The last type is recommended, because it allows the user to log out in the end of the session. The page will not be accessible when the accessibility is configured as NO ACCESS.

Security  When set to be secure, the page will be accessed only through HTTPS, which will encrypt the pages through OpenSSL. If the browser is in unsecure mode, the protocol and the port will change to HTTPS.

Privilege  This is the level of accessibility of the page. If the privilege is USER, any user will be able to access the page. If the privilege is FULL, only users with full access will be able to access the page. There are two levels between them: MONITOR and ADMINISTRATOR.

Task 2: Read the Username and the Password

This is done when the page must be accessed through authentication. If the username matches an entry in the users list, the following information will be available:

Enabled  The username must be enabled to be authenticated.

Encrypted password  The password passed by the browser must match the one registered in the entry.

Group  Each username is linked to a user group.
Appendix H - Web User Management

Task 3: Look for the group retrieved in the user groups list

The user group entry will have the following information:

- **Enabled:** The group must be enabled to grant access to the URL.
- **Privilege:** The group can have four privileges: in increasing order, they are USER, MONITOR, ADMINISTRATOR and FULL. The group privilege will be compared with the URL privilege. If it is greater or equal, the URL can be accessed by the user; otherwise, access is denied.

---

**Web User Management Configuration - Getting Started**

The users, groups and access limits for Web User Management are configurable with your browser, though it is not recommended to change the groups and the access limits. In the default configuration:

- The access limits have privileges based on the functionality of the Web page.
- There are four different groups (root, monitor, admin and user), each one with a specific privilege.
- There is one root user (username is root and password is tslinux).

**Changing the Root Password**

The first thing to do after logging into a Web session the first time must be to change the root password. See Security Issue under Figure 9: Configuration & Administration Menu page.

**Step 1:** Click on the link Web User Management > Users.

**Step 2:** Select the root user and click the Change Password button.

**Step 3:** Type the password twice and click the Submit button.
Appendix H - Web User Management

Step 4: Click on the link Web User Management > Load/Save Web Configuration.
   The Login page will appear.

Step 5: Type the username root and the password that was configured, then click on the Login button.

Step 6: After the authentication, click on the Save Configuration button.

Step 7: Click on the link Administration > Load/Save Configuration.

Step 8: Click on the Save to Flash button.

Adding and Deleting Users

Adding a User

Step 1: Click on the link Web User Management > Users.

Step 2: Click on the Add User button.

Step 3: Configure the new user.
   Type the username, the password (twice) and select a user group, depending on the access privilege desired. Leave the item Enabled checked.

Step 4: Click on the Submit button.
   A confirmation message will appear.

Step 5: If there are more users to be added, repeat the steps 1 to 4.

Step 6: Click on the link Web User Management > Load/Save Web Configuration.
Appendix H - Web User Management

**Step 7:** Click on the Save Configuration button.
This will save the users added in the file /etc/websum.conf.

**Step 8:** Click on the link Administration > Load/Save Configuration.

**Step 9:** Click on the Save to Flash button.

**Step 10:** Test the user(s) added.
Log out the current user (Go to the link Application > Logout) and log in again, with
the new user.

**Deleting a User**
The root user is delete-protected, and, because of that, it cannot be removed from the user
list. The other users can be deleted.

**Step 1:** Click on the link Web User Management > Users.

**Step 2:** Select the user to be deleted and click on the Delete User button.
A confirmation message will appear.

**Step 3:** If there are more users to be deleted, repeat the steps 1 and 2.

**Step 4:** Click on the link Web User Management > Load/Save Web Configuration.

**Step 5:** Click on the Save Configuration button.
This will save the users added in the file /etc/websum.conf

**Step 6:** Click on the link Administration > Load/Save Configuration.

**Step 7:** Click on the Save to Flash button.
Adding and Deleting User Groups

The default configuration already comes with four user groups, and, for most of the cases, they will be enough. However, you have the option of editing the user groups.

**Adding a group**

**Step 1:** Click on the link Web User Management > Groups.

**Step 2:** Click on the Add Group button

**Step 3:** Configure the new group.

   Type the group name and select the access privilege this group will have. Leave the Enabled item checked.

**Step 4:** Click on the Submit button.

   A confirmation message will appear.

**Step 5:** If there are more groups to be added, repeat the steps 1 to 4.

**Step 6:** Click on the link Web User Management > Load/Save Web Configuration.

**Step 7:** Click on the Save Configuration button.

   This will save the users added in the file /etc/websum.conf

**Step 8:** Click on the link Administration > Load/Save Configuration.

**Step 9:** Click on the Save to Flash button.

**Deleting a group**

Before deleting a group, make sure that there are no users using that group.

**Step 1:** Click on the link Web User Management > Groups.

**Step 2:** Select the group to be deleted and click on the Delete Group button.

   A confirmation message will appear.
Appendix H - Web User Management

Step 3: If there are more groups to be deleted, repeat the steps 1 and 2.

Step 4: Click on the link Web User Management > Load/Save Web Configuration.

Step 5: Click on the Save Configuration button.
   This will save the users added in the file /etc/websum.conf

Step 6: Click on the link Administration > Load/Save Configuration.

Step 7: Click on the Save to Flash button.

Adding and Deleting Access Limits

The default configuration has the access limits set according to the functionality of the Web page.

- Pages or forms which causes the configuration to change will have FULL privilege (only high-privileged users will have access to it).
- Pages which change the status of the board without changing the configuration will have ADMINISTRATOR privilege;
- Pages with the system information will have MONITOR privilege.
- Only application pages will have USER privilege.

Changing access limits is not recommended, unless you need to create or change the web server pages; even so, the user should place the web pages in the subdirectories with the privilege desired. For example, a page with ADMINISTRATOR privilege should be placed in /adm.

Adding an Access Limit

Step 1: Click on the link Web User Management > Access Limits.

Step 2: Click on the Add Access Limit button.
Appendix H - Web User Management

Step 3: Configure the new access limit.
Type the URL (or the subdirectory), and select the access privilege. If authentication is required to access the page, select COOKIE ACCESS; otherwise, select FULL ACCESS. If this page is confidential, check the Secure box.

Step 4: Click on the Submit button.
A confirmation message will appear.

Step 5: If there are more access limits to be added, repeat the steps 1 to 4.

Step 6: Click on the link Web User Management > Load/Save Web Configuration.

Step 7: Click on the Save Configuration button.
This will save the users added in the file /etc/websum.conf.

Step 8: Click on the link Administration > Load/Save Configuration.

Step 9: Click on the Save to Flash button.

Deleting an access limit

Step 1: Click on the link Web User Management > Access Limits.

Step 2: Select the access limit to be deleted and click on the Delete Access Limit button.
A confirmation message will appear.

Step 3: If there are more access limits to be deleted, repeat the steps 1 and 2.

Step 4: Click on the link Web User Management > Load/Save Web Configuration.

Step 5: Click on the Save Configuration button.
This will save the users added in the file /etc/websum.conf.

Step 6: Click on the link Administration > Load/Save Configuration.

Step 7: Click on the Save to Flash button.
Appendix H - Web User Management

This page has been left intentionally blank.
Appendix I - Connect to Serial Ports from Web

Introduction

Depending on how the serial port is configured, connecting to a serial port will either open up a telnet or ssh connection. A serial port configured as socket_server or raw_data will open up a telnet connection while socket_ssh will open up a ssh connection. Any Web user configured in the Web User Management section of the WMI will be able to use this application.

Tested Environment

Table 34: Windows XP + JREv1.4.0_01 or 02

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Internet Explorer 6.0</td>
<td>Success</td>
</tr>
<tr>
<td>Netscape 6/6.2.3</td>
<td>Success</td>
</tr>
<tr>
<td>Netscape 7.0</td>
<td>Success</td>
</tr>
<tr>
<td>Mozilla 1.1</td>
<td>Success</td>
</tr>
</tbody>
</table>

Requirements: Java 2 Runtime Environment (JRE) SE v1.4.0_01 or v1.4.0_02 (which can be found at http://java.sun.com/) installed on your PC with your browser acknowledged to use it. You can first check if the browser you are using acknowledges the Java version by following the procedures given in the next sections.
Appendix I - Connect to Serial Ports from Web

On Windows

From Internet Explorer
Go to Tools → Internet Options → Advanced. Scroll down and look for a section on Java. There should be a checkbox that says "Use Java 2 v1.4.0 ...." If there isn't, this could either mean your browser is not activated to use the Java plug-in that came with the JRE you have installed or it just means that you don't have any JRE installed, in which case please install and repeat the check.

If you have already installed JRE and you just want to activate your browser to use it, go to your system's Control Panel → Java Plug-in icon → Browser → check on the browser(s) you want to activate to use the Java Plug-in. Now repeat the check to see if your browser will now use the correct Java Plug-in.

From Netscape or Mozilla
Check to see if Java is enabled. Go to Edit → Preferences → Advanced → Check on Enable Java. To see what version of JRE Plug-in is used, go to Help → About Plug-ins. Scroll down to Java Plug-in section. Check if the Java Plug-in is the version you have installed.

Tip. When installing Netscape 7.0, it will ask if you want to install Sun Java. If you click on the box to install it, a version of JRE will be installed into your system; however, this does not mean that other browsers such as IE will recognize it. If you choose not to install Sun Java through Netscape but do it separately, Netscape 7.0 should automatically detect the JRE, and this can be checked by the instructions mentioned above.
Appendix I - Connect to Serial Ports from Web

Step-by-Step Process

Step 1: **Point your browser to the Console Server.**
In the address field of your browser type the IP address of your Console Server.

<Console Server’s IP address>

Step 2: **Log in.**
Log in with a user configured in the Web User Management section, and its password. This will take you to the Configuration and Administration page.

Step 3: **Select the Connect to Serial Ports link.**
Click on the Connect to Serial Ports link on the Link Panel to the left of the page in the Configuration section. This will take you to the Port Selection page. The ports will be listed by their server farm name if it were configured.

![Serial Port Connection](image)

Figure 49: Serial Port Connection page

Step 4: **Select port.**
On the Port Selection page, choose a port to connect to from the dropdown menu and click the Submit button. This will take you to the Port Connection Page.
Appendix I - Connect to Serial Ports from Web

Step 5: **Log in.**

If the port selected was configured as socket_server or raw_data, and depending on how it is configured to be authenticated, log in by typing into the terminal or use the command line input field to send input into the terminal.

If the port selected was configured for a ssh connection, a Login window will pop up. If you don't see it pop up, check your taskbar. Enter in the username and the username's password.
Appendix I - Connect to Serial Ports from Web

Step 6: Enter command.

Enter commands directly in the terminal or into the command line input field and hit Enter.

Step 7: To send a break to the terminal.

Click on the SendBreak button.

Step 8: Disconnect connection.

Click on the Disconnect button. Make sure the Status bar shows an Offline status.

Step 9: To reconnect to port.

Either refresh the current page or enter in the AlterPath Console Server IP address and the port into the IP and port field. Then hit the Connect button. (For ssh connection, the port number should be 22.)

To connect to another serial port and/or AlterPath Console Server, first make sure that you have disconnected from your current session. Then enter in the IP and port number into the appropriate fields and hit Connect. If you refresh the page now, the new connection will be lost and you will be returned to the original connection.
This page has been left intentionally blank.
Appendix J - Power Management

Introduction

The Cyclades-PM is a family of intelligent power strips (IPDU - Integrated Power Distribution Units), which is used for power management. Through a serial port, the administrator can use the Cyclades-PM to control all the equipment connected to its outlets, using operations like On, Off, Cycle, Lock, and Unlock.

Using the Cyclades-PM and the Cyclades Console Server together, the administrator can have full control over his data center equipment. He can, for example, reboot the data center equipment when it crashes, without leaving his console session (telnet or ssh). To do that, he must simply press a configurable hotkey and select the appropriate option from the menu displayed in the session.

Configuration

The AlterPath PM’s specific configuration is in /etc/pm.cyclades. This file has the default configuration, so the administrator does not need to change it. All the parameters that the administrator needs to change are in the serial port configuration section of the pslave.conf file.

Port Slave Parameters Involved and Passed Values

There are two different types of parameters:

1. Parameters to the port XX where the AlterPath PM is connected:
   - sXX.protocol IPDU: new protocol Integrated Power Distribution Unit
   - sXX.pmtype cyclades: the IPDU manufacturer
   - sXX.pmusers: the user access list

Format:

" <username>:<outlet list>[; <username>:<outlet list> ]"

<outlet list> is "<outlet number> [,<outlet number> [,<outlet start>-<outlet end>]]"
Appendix J - Power Management

- sXX.pmNumOfOutlets: the number of outlets of the AlterPath PM

2. Parameters to the other ports where the servers are connected:
   - all.protocol: CAS profile (socket_server, socket_raw or socket_ssh)
   - all.pmkey: the hot-key that starts a power management session. Default: ^p (Ctrl-p).
   - sYY.pmoutlet: the outlet list where the server YY is plugged. The outlet is passed as a pair PM_serial_port.outlet_number. If the server has a dual power supply, the outlets are separated by space char. For example the server has a dual power supply. One is plugged in the second outlet of the IPDU connected in serial port 1. The other is plugged in the third outlet of the IPDU connected in serial port 5. The value is “1.2 5.3”.

Configuration Example
The following example explains the configuration parameters. There is one server, one Console Server and one AlterPath PM. The server has its serial port (console) connected to port 2 of the Console Server and it's plugged into the outlet 8 of the AlterPath PM. The AlterPath PM has its serial port connected to port 1 of the Console Server.

Figure 52: Sample AlterPath PM Console Server setup
Appendix J - Power Management

Parameters for the example:

- s1.protocol ipdu
- s1.pmtype cyclades
- s1.pmusers jack:1-3, 8; helen 4, 5, 6
- s1.pmNumOfOutlets 8
- s2.pmoutlet 1.8
- s2.pmkey ^p

The user access list, in the example, permits jack to access the outlets 1, 2, 3 and 8, and helen the outlets 4, 5 and 6.

**vi Method**

The parameters described above must be changed by directly editing the `/etc/portslave/plsave.conf` file.

**Browser Method**

To configure Power Management to control IPDUs through the Cyclades Console Server's Web interface:

**Step 1:** **Point your browser to the Console Server.**

In the address or location field of your browser type:

`<Console Access Server’s IP address>`

**Step 2:** **Log in as root and type the Web root password configured by the Web server.**

This will take you to the Configuration and Administration page.

**Step 3:** **Select the Serial Ports link.**

Click on the Serial Ports link on the Link Panel to the left of the page or in the Configuration section of the page. This will take you to the Port Selection page.
Appendix J - Power Management

Step 4: Select the serial port where the IPDU is connected.
After selecting the port, click the Submit button.

Step 5: Click the PM8 profile button in the Wizard Section.
This will automatically set the protocol to IPDU, the IPDU type to cyclades, and the number of outlets to 8.

Step 6: Scroll down to the IPDU Section.
Change the number of outlets and the user permissions in this section, if necessary.

Step 7: Click the Submit button.
If there are more IPDUs to be configured, repeat steps 4 to 7.

Step 8: Select the port whose server has the power supply plugged into one or more IPDU outlets.
After selecting the port, click the Submit button.

Step 9: Configure the port as a Console Access Server.
Read the Access Method section in Chapter 3 for details.

Step 10: Scroll down to the Power Management Section
Set the hotkey to access the power management menu and the outlet(s) the server is plugged into.

Step 11: Click on the Submit button.

Step 12: If there are more servers to be configured, repeat steps 8 to 11.

Step 13: Make the changes effective.
Click on the Administration > Run Configuration link, check the Serial Ports/ Ethernet/Static Routes box and click on the Activate Configuration button.

Step 14: Click on the link Administration > Load/Save Configuration.

Step 15: Click the Save Configuration to Flash button.
The configuration was saved in flash.
Appendix J - Power Management

Wizard Method

**Step 1: Bring up the wizard.**

At the command prompt, type the following to bring up the Power Management custom wizard:

```
wiz --pm
```

Screen 1 will appear.

**Screen 1:**

***********************************************************
******** *CONFIGURATION WIZARD *********
***********************************************************

INSTRUCTIONS for using the Wizard:

You can:

1) Enter the appropriate information for your system and press ENTER. Enter '#' if you want to deactivate that parameter or
2) Press ENTER if you are satisfied with the value within the brackets [ ] and want to go on to the next parameter or
3) Press ESC if you want to exit.

NOTE: For some parameters, if there is nothing within the brackets, it will continue to ask for a value. In that case, you must enter a valid value or # if you do not wish to configure the value.

Press ENTER to continue...

all.pmNumOfOutlets : 8

Are these configuration(s) all correct (y/n) [n] :

How to Access the AlterPath PM regular menu from the Console Session

Step 1: Open a console session.
Open a telnet or ssh session for the serial port.

Step 2: Access the IPDU regular menu.
This should be done, for example, when the server crashes and it necessary to change the power status. Type the preconfigured hot-key.

If the user does not have permission to access any outlet, the following message will appear, and you will return to the Console Session:

It was impossible to start a Power Management Session
You can't access any Power Management functionality.
Please contact your Console Server Administrator.
If the user does not have permission to access the outlet(s) of this server, but can access another outlet, the following message will appear:

Please enter the outlet(s) (or 'h' for help):

The user should type the outlet(s) he wants to manage, before reaching the main menu. The main menu will appear only if the user has permission for this/these outlet(s). Typing 'h' will cause the session to show text explaining what to type, and 'l' will cause the PM session to be logged out, and the user to return to the Console Session.

If the user has permission to access the outlet(s) of this server, these outlets will be managed by the PM session.

Step 3: Regular Menu.

This is the AlterPath PM regular menu:
-------------------------------------------------------
Cyclades Corporation - Power Management Utility
-------------------------------------------------------
1 - Exit 2 - On 3 - Off
4 - Cycle 5 - Lock 6 - Unlock
7 - Status 8 - Help 9 - Other
-------------------------------------------------------
Please choose an option:
Appendix J - Power Management

Step 4: Check the status of the server’s outlet or the outlet list.
Type ‘7’ and wait for the answer. For example:

Please choose an option: 7

IPDU 1 Outlet 8:
Outlet Status User
8 OFF NONE

Cyclades Corporation - Power Management Utility

1 - Exit 2 - On 3 - Off
4 - Cycle 5 - Lock 6 - Unlock
7 - Status 8 - Help 9 - Other

Please choose an option:
Step 5: Reboot the server.

If the outlet(s) is/are locked, the user must unlock the outlet(s) first (option 6 - Unlock). The Cycle command turns the power off for some seconds and the turn it on again. Type '4' and wait for the answer. For example:

Please choose an option: 4

IPDU 1 Outlet 8:
8: Outlet power cycled.

Cyclades Corporation – Power Management Utility
1 - Exit 2 - On 3 - Off
4 - Cycle 5 - Lock 6 - Unlock
7 - Status 8 - Help 9 - Other

Please choose an option:
Appendix J - Power Management

**Step 6: Change the outlet list.**

If the user needs to access another outlet(s) which can be managed by him, the option 9 - Other should be used. For example:

```
Cyclades Corporation - Power Management Utility
1 - Exit 2 - On 3 - Off
4 - Cycle 5 - Lock 6 - Unlock
7 - Status 8 - Help 9 - Other
```

Please choose an option: 9
Please enter the outlet(s) (or 'h' for help): 1.2

```
Cyclades Corporation - Power Management Utility
1 - Exit 2 - On 3 - Off
4 - Cycle 5 - Lock 6 - Unlock
7 - Status 8 - Help 9 - Other
```

Please choose an option:

From this point, all the commands will be related to the 2nd outlet of the IPDU in the port 1.
Appendix J - Power Management

Step 7: Return to the Console Session.
The user can exit from the PM session and return to the Console Session in three ways:

1. Type the hot-key again, any time.
2. If the session is waiting for a menu option, type the option 1 - Exit.
3. If the session is waiting for the outlet, type 'l'.

When the user leaves the PM session, the following message will appear:

Exit from PM session

Power Management for the Administrator

The administrator, who can log onto the Console server itself, must have total control over all the IPDU outlets. An additional menu, with more options than the regular menu, is provided for the administrator to manage any IPDU.

There are two commands which can be used to manage the IPDU. The first one (`pm`) deals with menu options, while the second one (`pmCommand`) deals with the commands as they are sent to the IPDU, and requires more knowledge about the AlterPath-PM commands.

**pm command**

There are two ways to use this command: menu interface or command line. The menu is reached by typing the following command, from the prompt:

`pm <IPDU port>`
Appendix J - Power Management

For example:

[root@TSx000 /root]# pm 1

-------------------------------------------------------
Cyclades Corporation - Power Management Utility
-------------------------------------------------------
1 - Exit 2 - On 3 - Off
4 - Cycle 5 - Lock 6 - Unlock
7 - Status 8 - Help 9 - List
10 - Current

Please choose an option:

Some of these options require the outlet number (On, Off, Cycle, Lock, Unlock, Status), and others don’t. In the first case, when the option is selected, the number of the outlet will be asked. The user can enter one or more outlets (separated by commas or dashes), or “all,” to apply the option to all the outlets.

Following are examples of some things which can be done through this command.
Appendix J - Power Management

Turning the outlet off

Please choose an option: 3
Please enter the outlets (or 'help' for help): 4

4: Outlet turned off.

-----------------------------------------------------------------
Cyclades Corporation - Power Management Utility
-----------------------------------------------------------------

1 - Exit 2 - On 3 - Off
4 - Cycle 5 - Lock 6 - Unlock
7 - Status 8 - Help 9 - List
10 - Current

Please choose an option:
Appendix J - Power Management

Locking the outlets
When the outlet is locked, the previous status cannot be changed, until the outlet is unlocked. This means that if the outlet was on, it cannot be turned off and, if it was off, it cannot be turned on.

Please choose an option: 5
Please enter the outlets (or 'help' for help): 1-3

1: Outlet locked.
2: Outlet locked.
3: Outlet locked.

------------------------------------------------------------------------------------------------------------------
Cyclades Corporation - Power Management Utility
------------------------------------------------------------------------------------------------------------------
1 - Exit 2 - On 3 - Off
4 - Cycle 5 - Lock 6 - Unlock
7 - Status 8 - Help 9 - List
10 - Current

Please choose an option:
Appendix J - Power Management

Retrieving the status of the outlets

Please choose an option: 7
Please enter the outlets (or 'help' for help): all

Outlet Status User
1 Locked OFF NONE
2 Locked OFF NONE
3 Locked OFF NONE
4 OFF NONE
5 OFF NONE
6 OFF NONE
7 OFF NONE
8 OFF NONE

-----------------------------------------------
Cyclades Corporation - Power Management Utility
-----------------------------------------------

1 - Exit 2 - On 3 - Off
4 - Cycle 5 - Lock 6 - Unlock
7 - Status 8 - Help 9 - List
10 - Current

Please choose an option:
Appendix J - Power Management

The second way to use the pm command is the command line. In this case, the syntax for the command is

pm <IPDU port> <option> [<outlet(s)>],

where:

<option> is the name of the option, as written in the menu.
*outlet(s)* is the number of the outlet(s) the option will be applied to, and is used only if the option requires the outlet.

In the examples above, the same result can the achieved by using the command line mode:

Turning the outlet off

[root@TSx000 /root]# pm 1 Off 4

4: Outlet turned off.

[root@TSx000 /root]#

Locking the outlets

[root@TSx000 /root]# pm 1 Lock 1-3

1: Outlet locked.
2: Outlet locked.
3: Outlet locked.
[root@TSx000 /root]#
Appendix J - Power Management

Retrieving the status of the outlets

[root@TSx000 /root]# pm 1 Status all

Outlet Status User
1 Locked OFF NONE
2 Locked OFF NONE
3 Locked OFF NONE
4 OFF NONE
5 OFF NONE
6 OFF NONE
7 OFF NONE
8 OFF NONE

[root@TSx000 /root]#

**pmCommand command**

Through pmCommand command, the administrator has access to other options beyond the menu options, because he will be accessing the IPDU itself. The administrator must have a good knowledge of the Cyclades-PM command set to use it.

There are two ways to use this command. If only the IPDU port is passed as an argument, it will appear in a prompt where the administrator can write the command. Otherwise, the arguments after the IPDU port will be considered the PM command.

Syntax:

pmCommand <IPDU port> [<command>]
Appendix J - Power Management

For example:

[root@CAS root]# pmCommand 1

You're entering the "Power Management Prompt".

To go back to the Console Server's command line type: exitPm

[Cyclades - Power Management Prompt]#

The following are examples of some things which can be done through this command.
Appendix J - Power Management

Listing the commands available for the Cyclades-PM8

[Cyclades - Power Management Prompt]# help

on <outlet><cr> --Turn <outlet> ON
off <outlet><cr> --Turn <outlet> OFF
cycle <outlet><cr> --Turn <outlet> OFF and back ON
lock <outlet><cr> --Lock the current status of <outlet>
unlock <outlet><cr> --Unlock the current status of <outlet>
status <outlet><cr> --Show the current status of <outlet>
list<cr> --List users created and eventual outlets assigned
exit<cr> --Exit session
passwd <user><cr> --Set a password for the specific user
help<cr> --Show supported commands
current<cr> --Show the instantaneous current consumption for the entire unit
adduser <username><cr> --Add user to the DB (8 maximum users allowed)
deluser <username><cr> --Delete user from the DB
assign <outlet> <username><cr> --Assign <outlet> to a specific user
name <outlet> <name><cr> --Name an outlet

[Cyclades - Power Management Prompt]#
Appendix J - Power Management

Cycling all the outlets

[Cyclades - Power Management Prompt]# cycle all

1: Outlet power cycled.
2: Outlet power cycled.
3: Outlet power cycled.
4: Outlet power cycled.
5: Outlet power cycled.
6: Outlet power cycled.
7: Outlet power cycled.
8: Outlet power cycled.

[Cyclades - Power Management Prompt]#

Unlocking the outlets 1, 5 and 8

[Cyclades - Power Management Prompt]# unlock 1, 5, 8

1: Outlet unlocked.
5: Outlet unlocked.
8: Outlet unlocked.

[Cyclades - Power Management Prompt]#
Appendix J - Power Management

Power Management from a Browser

The Console Server Web server also supports power management. From a Web browser it is possible to check the status of all the IPDUs connected to the Console Server, as well as their outlets. If the user has Administration privileges, he can also perform the commands to turn on, turn off, cycle, lock and unlock the outlets.

**Step 1: Point your browser to the Console Server.**
In the address or location field of your browser type:

<Console Access Server s IP address>

**Step 2: Log in as root and type the Web root password configured by the Web server.**
This will take you to the Configuration and Administration page.

**Step 3: Select the Power Management link.**
This link is in the Administration section. The following page will appear:

![Power Management page](image)

In the figure above, all the outlets are off (the light bulbs are off) and unlocked. For this status, there are two possible commands: turn it on and lock it.
Appendix J - Power Management

The following steps are examples of what can be done in this page.

**Step 4: Turn the outlet 1 on.**

Click on the “On 48:1” button. The following page will appear:

![Power Management page after turning outlet 1 on](image)

After this operation, the outlet 1 was turned on (the light bulb is on), and now the administrator can turn it off and cycle this outlet.

**Step 5: Lock outlet 1.**

Click on the “Lock 48:1” button. The following page will appear:
Figure 55: Power Management page after locking outlet 1

The padlock indicates that outlet 1 was locked. From this point, nothing can change the outlet status, until the outlet is unlocked.
Appendix J - Power Management

This page has been left intentionally blank.
Appendix K - Examples

Introduction

The following three examples are just given to test a configuration. The steps should be followed after configuring the AlterPath Console Server.

Console Access Server

An example of a CAS environment is shown in Figure 56: Console Access Server diagram. This configuration example has local authentication, an Ethernet interface provided by a router, and serially-connected workstations.

Figure 56: Console Access Server diagram
Appendix K - Examples

The following diagram, Figure 57: CAS diagram with various authentication methods, shows additional scenarios for the AlterPath Console Server: both remote and local authentication, data buffering, and remote access.

As shown in the above figure, our “CAS with local authentication” scenario has either telnet or ssh (a secure shell session) being used. After configuring the serial ports as described in Chapter 3 - Additional Features or in Appendix C - The pslave Configuration File, the following step-by-step check list can be used to test the configuration.
Appendix K - Examples

**Step 1: Create a new user.**

Run the `adduser <username>` to create a new user in the local database. Create a password for this user by running `passwd <username>`.

**Step 2: Confirm physical connection.**

Make sure that the physical connection between the AlterPath Console Server and the servers is correct. A cross cable (not the modem cable provided with the product) should be used. Please see Appendix B - Cabling, Hardware, and Electrical Specifications for pin-out diagrams.

**Step 3: Confirm that server is set to same parameters as the ACS.**

The AlterPath Console Server has been set for communication at 9600 bps, 8N1. The server must also be configured to communicate on the serial console port with the same parameters.

**Step 4: Confirm routing.**

Also make sure that the computer is configured to route console data to its serial console port (Console Redirection).

**Step 5: Telnet to the server connected to port 1.**

From a server on the LAN (not from the console), try to telnet to the server connected to the first port of the AlterPath Console Server using the following command:

```
telnet 200.200.200.1 7001
```

For both telnet and ssh sessions, the servers can be reached by either:

1. Ethernet IP of the AlterPath Console Server and assigned socket port.

   or

2. Individual IP assigned to each port.

   If everything is configured correctly, a telnet session should open on the server connected to port 1. If not, check the configuration, follow the steps above again, and check the troubleshooting appendix.
Appendix K - Examples

Step 6: Activate the changes.

Now continue on to Task 5: Activate the changes through Task 8: Reboot the AlterPath Console Server listed in Chapter 2 - Installation, Configuration, and Usage.

Note: It is possible to access the serial ports from Microsoft stations using some off-the-shelf packages. Although Cyclades is not liable for those packages, successful tests were done using at least one of them. From the application’s viewpoint running on a Microsoft station, the remote serial port works like a regular COM port. All the I/O with the serial device attached to the AlterPath Console Server is done through socket connections opened by these packages and a COM port is emulated to the application.

Terminal Server

The AlterPath Console Server provides features for out-of-band management via the configuration of terminal ports. All ports can be configured as terminal ports. This allows a terminal user to access a server on the LAN. The terminal can be either a dumb terminal or a terminal emulation program on a PC.

Figure 58: Terminal Server diagram
Appendix K - Examples

No authentication is used in the example shown above and rlogin is chosen as the protocol. After configuring the serial ports as described in Chapter 3 - Additional Features or in Appendix C - The pslave Configuration File, the following step-by-step check list can be used to test the configuration.

Step 1: Create a new user.
Since authentication was set to none, the AlterPath Console Server will not authenticate the user. However, the Linux Server receiving the connection will. Create a new user on the server called test and provide him with the password test.

Step 2: Confirm that the server is reachable.
From the console, ping 200.200.200.3 to make sure the server is reachable.

Step 3: Check physical connections.
Make sure that the physical connection between the AlterPath Console Server and the terminals is correct. A cross cable (not the modem cable provided with the product) should be used. Please see the Appendix B - Cabling, Hardware, and Electrical Specifications for pin-out diagrams.

Step 4: Confirm that terminals are set to same parameters as the ACS.
The AlterPath Console Server has been set for communication at 9600 bps, 8N1. The terminals must also be configured with the same parameters.

Step 5: Log onto server with new username and password.
From a terminal connected to the AlterPath Console Server, try to login to the server using the username and password configured in step one.

Step 6: Activate changes.
Now continue on to Task 5: Activate the changes through Task 8: Reboot the AlterPath Console Server listed in Chapter 2 - Installation, Configuration, and Usage.
Appendix K - Examples

Dial-in Access

The AlterPath Console Server can be configured to accommodate out-of-band management. Ports can be configured on the AlterPath Console Server to allow a modem user to access the LAN. Radius authentication is used in this example and ppp is chosen as the protocol on the serial (dial-up) lines. Cyclades recommends that a maximum of two ports be configured for this option.

After configuring the serial ports as described in Chapter 3 - Additional Features or in Appendix C - The pslave Configuration File, the following step-by-step check list can be used to test the configuration.

Step 1: Create a new user.
Since Radius authentication was chosen, create a new user on the Radius authentication server called test and provide them with the password test.
Step 2: Confirm that the Radius server is reachable.
From the console, ping 200.200.200.2 to make sure the Radius authentication server is reachable.

Step 3: Confirm physical connections.
Make sure that the physical connection between the AlterPath Console Server and the modems is correct. The modem cable provided with the product should be used. Please see Appendix B - Cabling, Hardware, and Electrical Specifications for pinout diagrams.

Step 4: Confirm modem settings.
The AlterPath Console Server has been set for communication at 57600 bps, 8N1. The modems should be programmed to operate at the same speed on the DTE interface.

Step 5: Confirm routing.
Also make sure that the computer is configured to route console data to the serial console port.

Step 6: Perform a test dial-in.
Try to dial in to the AlterPath Console Server from a remote computer using the username and password configured in step one. The computer dialing in must be configured to receive its IP address from the remote access server (the AlterPath Console Server in this case) and to use PAP authentication.

Step 7: Activate changes.
Now continue on to Task 5: Activate the changes through Task 8: Reboot the AlterPath Console Server listed in Chapter 2 - Installation, Configuration, and Usage.
Appendix K - Examples

Appendix L - Wiz Application Parameters

**Basic Parameters (wiz)**

- Hostname
- System IP
- Domain Name
- DNS Server
- Gateway IP
- Network Mask

**Access Method Parameters (wiz --ac < type >)**

(CAS profile)
- Ipno
- Socket_port
- Protocol
- Users
- Poll_interval
- Tx_interval
- Idletimeout
- Conf.group
- <sN>.serverfarm
Appendix L - Wiz Application Parameters

(TS profile)
- Protocol
- Socket_port
- Userauto
- Telnet_client_mode

Alarm Parameter (wiz --al)
- Alarm

Authentication Parameters (wiz --auth)
- Authtype
- Authhost1
- Accthost1
- Authhost2
- Accthost2
- Radtimeout
- Radretries
- Secret
Appendix L - Wiz Application Parameters

Data Buffering Parameters (wiz --db)

- Data_buffering
- Conf.nfs_data_buffering
- Syslog_buffering
- Dont_show_DBmenu
- DB_timestamp
- DB_mode
- Syslog_sess

Power Management Parameters (wiz --pm)

- pmkey
- pmNumOfOutlets
- pmoutlet
- pmtype
- pmusers
# Appendix L - Wiz Application Parameters

Serial Settings Parameters (wiz --sset < type > )

(CAS profile)
- Speed
- Datasize
- Stopbits
- Parity
- Flow
- Dcd
- SttyCmd
- DTR_reset

(TS profile)
- Speed
- Datasize
- Stopbits
- Parity
- Flow
- Dcd
# Appendix L - Wiz Application Parameters

## Sniffing Parameters (wiz --snf)

- Admin_users
- Sniff_mode
- Escape_char
- Multiple_sessions

## Syslog Parameters (wiz --sl)

- Conf.facility
- Conf.DB_facility

## Terminal Appearance Parameters (wiz --tl)

- Issue
- Prompt
- Lf_suppress
- Auto_answer_input
- Auto_answer_output
Appendix L - Wiz Application Parameters

Terminal Server Profile Other Parameters (wiz --tso)

- Host
- Term
- Conf.locallogins
Appendix M - Copyrights

References

The AlterPath Console Server is based in the HardHat Linux distribution, developed by Montavista Software for embedded systems. Additionally, several other applications were incorporated into the product, in accordance with the free software philosophy.

The list below contains the packets and applications used in the AlterPath Console Server and a reference to their maintainers. The copyrights notices required in some packets are placed in the /COPYRIGHTS directory of the AlterPath Console Server image.

Authentication
Authentication is the process of identifying an individual, usually based on a username and password. In security systems, authentication is distinct from authorization, which is the process of giving individuals access to system objects based on their identity. Authentication merely ensures that the individual is who he or she claims to be, but says nothing about the access rights of the individual. (Source: www.webopedia.com)

Break Signal
A break signal is generated in an RS-232 serial line by keeping the line in zero for longer than a character time. Breaks at a serial console port are interpreted by Sun servers as a signal to suspend operation and switch to monitor mode.

Console Access Server (CAS)
A CAS has an Ethernet LAN connection and many RS-232 serial ports. It connects to the console ports of servers and networking equipment and allows convenient and secure access from a single location.

Console Port
Most of the equipment in a data center (servers, routers, switches, UPS, PBX, etc.) has a serial console port for out-of-band management purposes.

Cluster
A cluster is a group of one or more computers working as a group to execute a certain task. From the user standpoint, a cluster acts as a large computer system.

Flash
Flash refers to a type of memory that can be erased and reprogrammed in units of memory known as blocks rather than one byte at a time; thus, making updating to memory easier.

In-band network management
In a computer network, when the management data is accessed using the same network that carries the data, this is called “in-band management.”
Glossary

IP packet filtering
This is a set of facilities in network equipment that allows the filtering of data packets based on source/destination addresses, protocol, TCP port number and other parameters. Packet filtering is one of the main functions of a firewall.

KVM Switch (KVM)
Keyboard-Video-Mouse Switches connect to the KVM ports of many computers and allow the network manager to access them from a single KVM station.

Mainframe
Large, monolithic computer system.

MIBs
Management Information Bases. SNMP-compliant devices, called agents, store data about themselves in MIBs and return this data to the SNMP requesters.

Out-of-band network management
In a computer network, when the management data is accessed through a network that is independent of the network used to carry data, this is called “out-of-band network management.”

Off-line data buffering
This is a CAS feature that allows capture of console data even when there is no one connected to the port.

Profile
Usage setup of the AlterPath Console Server: either as a Console Access Server (CAS), a Terminal Server, or a Remote Access Server.

RADIUS
Protocol between an authentication server and an access server to authenticate users trying to connect to the network.
Glossary

RISC
Reduced Instruction Set Computer. This describes a computer processor architecture that uses a reduced set of instructions (and achieves performance by executing those instructions very fast.) Most UNIX servers (Sun Sparc, HP, IBM RS6000, Compaq Alpha) were designed with a processor using a RISC architecture. The Intel \textsuperscript{®} x86 architecture.

RS-232
A set of standards for serial communication between electronic equipment defined by the Electronic Industries Association in 1969. Today, RS-232 is still widely used for low-speed data communication.

Secure Shell (SSH)
SSH has the same functionality as Telnet (see definition below), but adds security by encrypting data before sending it through the network.

Server Farm
A collection of servers running in the same location (see Cluster).

SNMP
Short for Simple Network Management Protocol, a set of protocols for managing complex networks. The first versions of SNMP were developed in the early 80s. SNMP works by sending messages, called protocol data units (PDUs), to different parts of a network. SNMP-compliant devices, called agents, store data about themselves in Management Information Bases (MIBs) and return this data to the SNMP requesters. (Source: Webopedia)

Telnet
Telnet is the standard set of protocols for terminal emulation between computers over a TCP/IP connection. It is a terminal emulation program for TCP/IP networks such as the Internet. The Telnet program runs on your computer and connects your PC to a server on the network. You can then enter commands through the Telnet program and they will be executed as if you were entering them directly on the server console. This enables you to control the server and communicate with other servers on the network. To start a Telnet session, you must log in to a server by entering a valid username and password. Telnet is a common way to remotely control Web servers. (from webopedia.com)
Glossary

Terminal Server
A terminal server has one Ethernet LAN port and many RS-232 serial ports. It is used to connect many terminals to the network. Because they have the same physical interfaces, terminal servers are sometimes used as console access servers.

TTY
The UNIX name for the COM (Microsoft) port.

U Rack height unit
A standard computer rack has an internal width of 17 inches. Rack space on a standard rack is measured in units of height (U). One U is 1.75 inches. A device that has a height of 3.5 inches takes 2U of rack space.
